This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

+ *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.

+ *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.

+ *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.

+ *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at `http://books.google.com/`

PREFACE

NATURALLY, a work of this kind must be abridged. When woman started from her ancient bondage for modern freedom, she hit a long trail. I shall try to blaze that trail. She has been on the way some time, but she never knew where she was going—nobody does. Progress has no ultimate goal—it can't have. It has an instinct. It is a wanderer. It passes through successive zones that are repeated. They can not be infinite in number and diversity, because *being* is limited in its reactions. There is not even conception of infinity. *Being* is necessarily provincial. It is characterized by its surroundings. Cosmic consciousness is an idea. God is hope. Immortality is a dream. Is there truth in the idea? Is there reality in the hope? Is there prophecy in the dream? No one knows. The very soul of our race is dumb, or, at best, inarticulate in its cries and vague in its longings.

In the long run, progress may be like a dog chasing his tail. Activity is good for the dog even if he misses the rabbit; but if we assume

that he will catch the rabbit, what then? Shall he stop, or catch another and another forever and ever? Still, if progress turns out to be only a movement with an active instinct, I like to think that the instinct makes for well-being. The bewildering fact is that it doesn't. For nothing so bedevils us as that which we call progress. Let us say then that bedevilment is good (for the soul) since we can not abate it. Let us go in for progress, as everybody does.

Here the trouble begins. Each knows the road that all the world should take, but no two roads are alike. I see one that looks promising. It seems to be a continuation of the trail, leading to broader human rights from the narrower rights of sex or class. This road passes I hope to an equal spiritual dignity of manhood and womanhood, opening up the possibilities of human nature through orderly activity.

Of course, no wise woman travels alone if she can help it. Nature loves nothing better than mating. Nature is hard-headed. According to her, almost any kind of a mate is better than none. In general, her children obey her,—in one way or another. Those who do not obey the mother are weaned before it is good for them; that is to say, they are runted out of existence.

So we find that woman in her trail from relative bondage to comparative freedom had

company all along. She was both helped and hindered by her companion; but she was helped more than hindered, because her very hindrance often was a help.

At all events, a stage has been reached where no one doubts the desirability of equal opportunity and equal responsibility of men and women under the law; and nobody should question the wisdom of their equal moral obligations to society, on given conditions. There also is common agreement on the right to freedom of speech within the limits of decency, regardless of sex; and no one now who loathes caste doubts the fitness of women for full citizenship with men.

When women discuss with each other the established order of things, they accomplish little; but when men and women together examine established orders with care and discuss them publicly with freedom, if not always with judgment, much is accomplished. The interested parties find points of agreement. Intrenched systems yield to the slow attrition of agitation. Deep in our hearts we know that agitation is not pernicious when it quickens the social conscience; that no good system can be harmed very much by agitators; and that no bad system should be exempt from criticism. This is true of all systems—religious, economic, and the others.

The ever-increasing recognition of woman's right to a voice in public council is beginning to show good effects. Cosmopolitanism is awakening. Fanaticism is disappearing from patriotism. We are beginning to see that the love of mankind develops from a proper regard for the interests of home, community, country. If it is true that an interest in the welfare of neighbors does not impede nor impair one's patriotic impulses, then patriotism should strengthen rather than weaken one's love for humanity. This truth is exemplified in the lives of all great men and women.

It is natural for love to radiate from the hearth—to link up with kin, friend, and fellow, and thus to extend from a personal center to the impersonal circumference, if it would encompass all that lies between. But as the love of family, friend, and neighbor does not imply the hatred of strangers, neither should the love of country breed intolerance of the patriotism in other lands. For if patriotism is right in one country, it is right in all countries. Those of us who heartily accept "Old Glory" as the hallowed symbol of our national aspirations, reverently salute other flags.

Woman knows better than man that love, like visual perception, decreases in definition as the horizon broadens. Emotion tempers justice both in man and woman, but more in

woman than in man. Therefore a greater feminine element in the judiciary would be an improvement. Flexible emotion is better for society than inflexible justice is for anything. Absolute justice would wipe us all out—the judges with the rest. There are many kinds of justice; and until we master them all we can not hope to become civilized. It is not humanly possible, for instance, to mete out precisely the same quality of justice to friend and foe; if it were, friendship would be an empty pretense. The same rule of justice can not be applied to the halt and the fit, to the blind and those that see, to the weak and the strong. The architect of this world made no provision for a Hall of Justice; and for that reason perhaps we have failed to establish so much as a single court of justice on earth. Even our worship of abstract justice is a form of fetishism. Many other things are as important as justice is to our human condition; and one of these is an elastic emotion that has a healthy rebound. Only a heartless machine could judge alike the next-door neighbor and a stranger on the far-away steppes of Manchuria; yet only a savage would interpret the kindly feeling for the one into terms of cruelty to the other. In a word, unqualified universal eternal justice is the cry of a mad soul debauched with idealism.

Nobody wants it; nothing deserves it,—least of all the human being.

Women are the essential religionists of the race. They are as subject to false gods as to the effects of the moon. Therein lie their political instability, their economic weakness, and, as a sex, their unfitness to govern. Owing to no fault of their own, they have been slaves too long to be good masters. I am glad for every slave that becomes a master; but I shrink from a master that has been a slave. Therefore, firmly believing in the woman's movement, also I believe in the man's. I think man and woman should move together, or, what amounts to the same thing, synchronously. Each sex should do that which it can do better than the other sex. Man and woman must perform together, but, if they would get on, each must do the thing that each is adapted for by the natural order of existence. For everything that interests them jointly is an elaboration of sex divergence into sexual conjunction.

Some of these things I shall try to set forth whilst blazing the trail here and there from woman's bondage to freedom. Incidentally among other topics, I shall discuss the freedom of choice in mating and in the bearing of children. The ethics of marriage, the desirability of easy divorce, and the hideous evil of prostitution will be lightly touched in passing; but

no matter how much we cry between the silences of yesterday and to-morrow, the long trail will go forward just the same into the unknown generations of the world. For still

"We are the ancients of the earth,
And in the morning of our times."

WOMAN FROM BONDAGE TO FREEDOM

EARLIEST MANKIND

HE earliest status of woman is unknown. From our knowledge of early mankind, however, we may speculate on the remote problems of sex. At the dawn of humanity perhaps there were no problems of that kind. In the beginning, sex cleavage was expressed merely in beast-like motherhood and fatherhood.

Everything depends from something else. The earliest human beings were aristocrats; they had attained a high and a secure position in life as it was at that time. They were beginning to walk around mostly on their hind legs. Some of them actually strutted. I really think they did, because our strutting started sometime and it may as well have been then. Also the dawn of ancestral pride may have broken on their waking minds at about the same period; for they were the ancestors of all our kind.

Their crests were thinning frontal bones;
Their coats of arms were hairy hides;
Their proud estates were clubs and stones,—
And we inherit all, besides
Their pride of blood that still abides.

Where they originated, no one knows. It is probable that the ancestors of mankind lived in the forests of the great plains of Southern Asia, or perhaps on the Mongolian plateau. Their westward migration must have begun ages before the human stage was reached. Anthropologists believe, however, that human traits were first developed in the East during an extremely early period. For this reason we repeat the old saw, "Asia was the cradle of our race."

The aristocracy of to-day suffers no humiliation from the fact that anthropoid apes and men sprang from a common stock. Time is gracious: it softens grief and it assuages the shame that stings like an adder's tooth from graves forgot. The divergence between ape and man began so long ago that now the blood of neither contaminates that of the other. An occasional reversion to type is momentarily disconcerting; but we have learned that everything reasonable may be borne by rational beings; and there is balm in the belief that the racial cleavage is ever widening.

The study of our remote ancestry takes us

back to heroic times when social distinctions, or the lack of them, forced men and women to be neither liars nor hypocrites. They were frankly what they were. They lived in happy freedom from the wiles of professional religionists; and there were no capitalists in those days to exploit them, nor labor organizations to pester them. There were neither kings nor slaves, riches nor poverty. Human parasites and prohibitionists and politicians had not begun to breed, because social filth had not yet been deposited by civilization. To those blessed æons we must hark back if we would be happy in our dreams.

Although our common ancestral stock is not precisely known, we suspect one branch of the Old World primates. It is unnecessary to try to follow this branch down through the ancestral anthropoids of Egypt, however interesting it might be to do so. The mists of the Early Tertiary Period are too thick for clear vision. But humanly considered, the most important event in Time, which Pythagoras called the soul of our world, occurred in this period; for it gave to us our remote Pliocene ancestors, already fast running humanward through the dim ages.

Our family tree is a big one. It has many distinct branches. The earlier branches were formed in the vast continental region now

called Eurasia. During the Old Stone Age some of these branches crept over to Western Europe; some became extinct while they still were in a prehuman state, and others long after they had become distinctly human.

Beginning now anywhere in the well-defined human zone of development, let us try to visualize conditions in remote prehistoric ages. At first thought it seems hopeless to expect more than a fanciful picture; and if we were to rely solely on facts relating to contemporary groups of savages we should fail to get a true picture. For although some of these groups virtually live in the distant past, they differ in many vital respects from similar groups living no longer ago than thirty or forty thousand years.

Fortunately, we have a great deal of data gathered, it is true, in fragments slowly and laboriously, but from many reliable sources. These data must be assembled, and from them we must make our deductions. This process will give us the groundwork or scenario. Some knowledge of the principles governing the conduct of human beings in their struggles with the environment, and their rebounds resulting from these activities, together with some understanding of their relations with each other—relations which were slowly crystallized, as it were, by the laws of aggroupment—will enable us to produce the film of a mental moving-

picture which shall visualize to us the unknown past almost as truthfully as contemporary life and incident may be thrown upon the screen.

Before making the pictures, let us see how we can piece together the scenario and where we get the material. For the sake of convenience, we will lay the scene in Western Europe at a time when the beings who inhabited that region were as distinctively human as are we ourselves. For, during the Old Stone Age, man already had received the heritage which, for short, we call the *soul.*

During many ages the prehuman ancestors of man had aspired, subconsciously perhaps, to an upright carriage. For ages, man himself had known the benefit of the erect posture. His changed physical attitude was, in some mysterious manner, the forerunner of his spiritual attitude. He was beginning to look toward the stars. But the slow change from four legs to two did not carry with it unalloyed blessings. As man arose from the more or less horizontal to the perpendicular posture, he began to hope, to dream, to laugh, and to weep. Spiritual suffering came not through the "fall" of man but through his rise. His new posture also imposed anatomical penalties, the effects of which have not yet passed away. The abdominal cavity, for instance, is ill-suited to carry the viscera in an upright posture. But

the liberation of the arms in locomotion; man's ability to travel erect on two hind-limbs; and the transfer of the anthropoid function of the big-toe of the fore-foot to that of an opposable thumb of the human hand, were an enormous recompense for the ills suffered through the change. From the ability to suffer as a man came his faculty to enjoy as a god. His new sorrows broke into ripples of laughter; his horizon broadened; his spirit longed for wings.

For ages, man's brain had been helped in its development by the advantages of his opposable thumb, perfectly capable of co-operating with each of his four fingers. The hand had become an efficient assistant of the brain. The more he used his hands, the more he stimulated the development of his brain; and the more his brain developed, the more skillful became his hands. We utilize this reaction between hand and brain even to-day in the training of children.

For ages, the brain had been growing and undergoing adjustments of mass suitable to superanimal needs. One of the most marvellous acquirements of the human brain was its power of speech in one little area of either hemisphere. In the right-handed person, this speech-center became localized in the left. A little spot, situated in what is called the convolution of Broca, had become susceptible to an

acquired change that made speech possible. Thus man found himself endowed with the gift of articulate speech. Without going into the reasons why, this could only have come about through the use of his hands during his individual and racial childhood.

Yet strangely enough, the faculty of speech is not congenital. Man is born as dumb as any other animal; but unlike other animals, he is born with the will-power of bringing forth in his brain a faculty that sets him apart from all the beasts of the earth. Still, no language ever came to him spontaneously. Every word was born of a need. His mind kissed his brain and words blossomed from his lips. Nor did the words issue merely as sounds, but they came full-fledged as verbs, nouns, and other parts of speech which make up a language in its infancy.

The development of the faculty of speech was not owing to any difference in brain-structure, since anatomically it is the same with several groups of primates. But in man's brain, the particles of gray matter in a part of the cortex when subjected to the incessant repetition of certain stimuli develop the power of speech. Why is this? We say, rather loosely, that the personality longs to communicate with its fellow in accordance with one of the feminine instincts of the race. The first effort to speak

was a gesture; and the first "language" was not of the tongue, but of the hand—a gestural speech. Thus language was born of the hand; and spoken language, even in its most perfect form, still retains a large gestural element. The source of words is in the mind; their impellant force is personality urged by the interaction between need and longing. Words are inventions of the mind, which the brain, the nerves, and the muscles have learned to use.

During the long period from somewhere well within the Miocene and extending through the Pliocene Age, a steady and coincident development took place of the hand, the brain, the powers of upright locomotion, and of speech. Already, as we have seen, in Early Quarternary Times this development had reached the flower called human.

At this time we find our prehistoric *human* ancestors in Europe. They walk as we walk; they have our hands and brains. Their speech is rudimentary, but the brain-centers related to the higher senses are well developed, and they control perfectly all motions of the bodily members. The anterior centers of the brain are keenly awake, and they have long been busy in the hoarding of experience and the developing of ideas. Fifty thousand or more years ago these groups of intelligent human beings possessed faculties and powers in all essentials

"modern", though still in the dawn of education. These folk saw as we see, felt as we feel, and they otherwise functioned as we function to-day. They were men and women with our emotions, hopes, and dreams. They were bound to our cycle of childhood, vigor, and senility—beings of our own intellectual timber, more roughly hewn perhaps and more ruggedly joined.

Looking back beyond these racial groups through the concentric plenitude of time, we see others vaguely—others still that are intelligent and still of an Eastern origin, yet ever lower as the period recedes, until the earliest ancestry of man is lost in brutedom.

During a period covering more than a hundred thousand years, reaching to the dawn of human culture, Europe has been the habitat of man. The record of his residence is unbroken; and the knowledge of his environment, of his life, and of his art is virtually complete. We know that he has been manufacturing implements for upwards of 125,000 years. We know the varieties and the habits of the animals that he knew; and we are familiar with the vegetal life that surrounded him during all that time. Through this knowledge we are enabled to visualize the status of early womanhood.

The various elements of our knowledge cov-

ering this almost inconceivable lapse of years could be gathered only from many different sources by many diligent and well-equipped students. And then it is necessary to make a synthetic study of the facts gathered from a careful investigation of plant and animal life, of climate, of geography and geology, of relics and remains, of mental development, and of the physical modifications of the different racial groups, of their arts and industries which connect them with their surroundings and which reveal the relations between the intellectual and the material world.

We may look into the mirror of time for reflections of eternity; but we must interpret these reflections in thought; and our chronology can not be founded on mere conjecture. We know, for example, that the Old Stone Age was contemporaneous with the Glacial Epoch. This gives us a time-scale in the snow-levels and consequent temperatures which conditioned mammalian life. With the help of such and countless other facts, we may determine the order of succession of species and, in general, the order of their physical modifications. We know that the Ice Age of Europe was multiple; that there were Glacial and Interglacial Stages. This knowledge supplies the means of computing the grand divisions of time, whilst the development of the flint industry, the progress of

invention, of art, and of the chase afford us a fair working-knowledge of the subdivisions of time.

The imagination is quickened by a contemplation of the art and the industry of a people who vanished many scores of thousands of years ago. The same stars are overhead, the same earth is underfoot, the same gray old ocean moans upon the shore; but all else, how changed! Verily, life is a sea of changing clouds bounded by the infinite mysteries of generation and death.

Nothing else is so universal and so constant as change. Nothing happens without it. Change is the archagitator of cosmic life. It is opposed to spiritual stasis, to moral stagnation, to intellectual inertia. Is progress only a phase of change, or is change the very soul of progress? We only know that the spirit of change thrills the established order with aspiration for a better order; and that it enables man to use the imperfections of all his systems as stepping-stones. Change is elemental—coeval with life. Change is the sole hope of death—the only star that shines in the night of mortal tragedy. Change is the only promise that the gods have given to men; and if it is read sympathetically, it gives us hope.

And so you see that every new age proceeds from an older just as a child issues from the

parent. There is a harmony in all the epochs of the world, a harmony that seems like a song of the supreme voice of the universe. One religion gives way to another, not always a better. For change has rhythm, and progress has rhythm; and no advance is continuous of level, of even intensity. Only the rhythm passes through progressive periods; and thus progress is best seen in large-scale perspective. One race suceeds another. In the lines of Pope:

"Like leaves on trees the race of man is found,—
Now green in youth, now withering on the ground;
Another race the following spring supplies:
They fall successive, and successive rise."

One philosophy makes room for another. One system of economics displaces another. Species supplant species. And why? Because change is cosmic, eternal, rhythmic, and, we hope, progressive. All our shining achievements—every thought and act individually and collectively expressed in whatever form; in mechanics, in chemistry, in art, in science, in ethics, in economics—every one is as a bit of cosmic dust energised by the spirit of change.

One of the most significant facts in the study of prehistoric man is his rapid spiritual ascendancy. That his higher development was relatively swift and intensely progressive is made evident by an examination of his ana-

tomical remains, chiefly of the skull, the center of his evolutionary advancement. Indeed a multitude of facts indicate that his spiritual growth was rapid.

For much of our knowledge along these lines, the world is indebted to the investigations of such scholars as Cartailhac, Breuil, Obermaier, Osborn, Avebury, Bégouen, Boule, Broca, Darwin, Déchelette, and a host of others. Through their eyes, as it were, we are enabled to visualize prehistoric times. These men have laid bare the industries of the Old Stone Age in their complete sequence. They have made us familiar with the climate; and by their magic, the ancient *flora* and *fauna* once more act their vital parts on the world's stage for our instruction. Through the tireless industry of savants we may make our pleasure-excursions to the old camping-stations of Upper Palæolithic Times, and we may follow for our amusement, if we wish, the prehistoric invention of implements that has left its trail in such fine gradation.

The result is that modern man gains a new conception of the antiquity of his race. He is better able to understand now than ever before the unfolding of the human spirit as it occurred in very ancient times. Relationships are established across thousands of changing years, forming a medium through which the mind of to-day

may come in touch with the powers of human observation, of discovery, and of invention during a period so remote that in contrast with it the antiquity of Old Babylon is of yesterday.

History that is written in books never is wholly truthful nor generally reliable. The reason for this is that the historian is human: the work suffers from the frailties and imperfections of the workman. But the history that is recorded by the works of change in soil and rock is exact truth to one capable of reading Nature's inscriptions.

When Greek conceptions of man's origin are compared with the records left by Nature, the parallelism is remarkable. Lucretius, who went to Greek sources for his science and philosophy, foreshadowed our knowledge of prehistory in his poem, *De Rerum Natura*. The poem is pictorial. It conjures from words a moving-picturelike drama acted in primitive epochs. Through it we catch glimpses of our kind in preagricultural periods. We see how ancient-man lived and how he developed. The relative status and the occupations of men and women are clearly perceived. We are enabled to understand how the cordial virtues blossomed at the fireside, and how man's savagery was slowly chastened by his growing love for wife and child.

From Æschylus to Horace, the Greek conception of human natural history was dominant. At the rise of the new religion this wholesome view was obscured by the dogma of special creation—a nightmare that swept the Western World triumphantly until about the sixteenth and seventeenth centuries, when studies in comparative anatomy began to awaken the understanding, giving birth to doubt; and doubt started the mind toward discoveries that have all but wiped away the many absurdities, chief of which was the anthropomorphic divinity—a god who not only shaped our ends according to childish whim, but who pried into our private affairs which were not even of local importance, and who prescribed our prayers, our fasts, and our feasts.

With the rise of modern anthropology, the Mosaic doctrine of special creation was doomed. Buffon thought man might be sensitive at the discovery which proved him to be "an animal in every material point". The pride built around our Western religious conception of ourselves and centered in our fabled origin has suffered, but it still remains as a sore spot under clerical influence. However, the doctrine of evolution engaged broader conceptions wherein there is room for the dignity of the human soul to expand and to amuse itself by indulging a multi-

tude of harmless vanities regardless of Lamarck's shocking belief that the temple of the spirit is nothing more than the modified body of an anthropoid ape.

WOMAN IN PREHISTORY

DESTINY made motherhood the chief occupation of prehistoric women. Fatherhood was a mere incident, a diversion from the chase, a pleasant avocation. Motherhood became a vocation when humanity emerged from prehuman beings. As we look backward along time's ever-narrowing vista the milestones crowd together until it seems that motherhood leapt from the function of fortuitous reproduction among animals to an imperative calling thrilled with spiritual aspiration.

Motherhood was a multiple calling in early primitive epochs. It made other occupations necessary. It was enlivened with subtle phantoms; and it carried "the sad burden of some merry song". It moulded the form of woman, and it has shaped the soul of man. If God ever spoke to mortals, it was through motherhood, not through a book. Ceaselessly He knocked at the door of human consciousness, as it were, bidding it to open and to admit the tenderer virtues. Perhaps mercy first entered the heart of man through this door. Sympathy

is a feminine trait. The primordial savage spared the life of an orphaned babe because his woman had brought forth a similar stranger equally helpless. Primitive woman suckled the waif because her own babe had lain at her breasts. She first sheltered a young being, more ape than human, because she thought of her own offspring. She fed a strange child because the hunger-cries of her own were ringing in her memory. Some of her earliest virtues were born of the make-believe. She held an alien child in her arms and made believe it was her own. She mourned the loss of her first-born and lo! her grief turned into imagination.

Early in the dawn of humanity, motherhood was a well-established occupation. As humanity waxed, this occupation differentiated to specialize on what we now call the virtues. It learned to grow the flowers that long for moths and moonlight, as well as those that love the bees and the hot sun. Man was engrossed in the seeking of food for himself. He became the hunter. Woman was occupied in the seeking of food for herself and her young. Thus motherhood was the seed of altruism sown in the fairy dust of earth when the world was young.

When the primitive mother had to lay up from the chase—when she was compelled to watch and guard her babes—to slacken her

arduous efforts for a period—she usually found herself short of meat. At such times, when the season was favorable, she ate roots and herbs and the seeds of wild grasses. Remembering her hardships, her hunger and want, she invented agriculture. She probably invented fire. She was the first to cook. She made the first home, and she will preside over the last. Love came to her heart ages before it entered man's. She invented art; and she was the first to dream of immortality.

As sexual relations broadened into other forms of co-operation between men and women, labor slowly differentiated. The division of labor made woman a drudge. Her sex became domestical. She was driven to sustained effort. Man, always the hunter, naturally became the warrior. Nature fitted him for bursts of speed. Vitally, he was a spendthrift, and a spendthrift he has remained. In vitality, woman was the banker. Very early in her career she became inured to routine. Routine is a form of bondage.

Gradually men began to co-operate for purposes of war and the chase. They became gregarious. Woman remained solitary. She developed resources, and the faculty of meditation that was the mother of her intuition. Her mental trajectory diverged from man's. She was the first thinker. Her solitary periods

fostered her self-reliance, her ingenuity. She was first to seek shelter and to wear clothes. She excelled in the arts of peace as man excelled in the arts of war. She invented the needle. She discovered the uses of grease. She was the first to dig a hole, to plant a seed —to erect the pole-house, around which she wove twigs, or covered the poles with bark and leaves. She was first to dress hides. She invented the pelt-raiser, the skin-scraper. As the Ice Age approached, she made rude garments of vegetal fiber and of skins, sewing them with sinewy thread of her own production. She fashioned the first shoes. She devised the water-vessel, the basket, the first crude pottery, the first agricultural implement which probably was a stick, sharpened and point-hardened by flame. She was the first miller—first to pound seeds with stones and to grind them with mullers. She originated the granary. She invented drag-poles ages before man invented the wheel. She invented civilization.

Woman made the cat and the dog domestical. She domesticated the plants. Man tamed dogs, cattle, reindeer, sheep, and horses; and woman domesticated them. Man was the shepherd; woman was the farmer. The Neanderthal hunters drove the cave-bear and the hyena from the caverns, converting the en-

trances into homes and camps. They hunted the mammoth, the wild-horse, the rhinoceros, the giant deer, the reindeer, the bison, and wild cattle. The women prepared the meals, or rather the irregular gluts; they dressed the pelts—made them into covers and clothes. Women laid the hearthstones at the entrances of the caves, so they could work in the open daylight. At night and during rainy or inclement weather, they retired just within, making their beds well back from the mouth of the grotto.

Man raided the lair of the wolf—trained the cubs to aid him in the chase; but it was woman who converted the wolf into a warder of the fireside and the friend of mankind. She dismembered the game where men and dogs brought it down. She split the marrow-bones; she clove the skull for its brains; and she transmuted tooth, tusk, and claw into ornaments and talismans. She invented the fat-burning lamp to succeed the torch; she tended the fires; she guarded the springs; she protected her young from marauders at the cave-entrance; she devised the first crude implements of the hearthside; she gathered the natural tar for making her baskets water-tight. In a word, she was man's help that was meet for him.

Man was familiar with the virgin forests, with their wild denizens. Woman knew the

plants. The great Ice Age was approaching. Forests, plants, and animals of central France and northern Italy were beginning to feel the coming change. The forests were not unlike those of our central states. There were sassafras trees, the roots of which woman already had learned to use. There were locusts, sumachs, the bald cypress, and the tulip. In northern Italy were forests of sweet and sour gum, of the bay, and of other varieties such as we have to-day in the Carolinas. Along the Mediterranean were bamboos, palms, and the sequoia. All over central France were thriving forests of oak, poplar, willow, beech, and larch. These for the most part survived the Glacial rigors to reforest Europe in Post-Glacial times; but many types, some of which we now have in America, became extinct in Europe.

The forests abounded with several kinds of monkeys. There were Asiatic mammals such as the rhinoceros, the mastodon, the antelope, the gazelle. Hyenas lurked in the shadows; the African hippopotamus wallowed in the river-bottoms; there were saber-tooth tigers, and several species of deer. There were African-Asiatic mammals such as elephants, wild boars, lynxes, foxes, and wild-cats. In the rivers were otter and beaver; on the hills were the hares. As some of these animals disappeared before

the lowering temperature, others, such as the northern musk-ox, took their places.

In the region of England, where the climate was warmer than at present, there were forests of maple, elm, birch, alder, oak, pine, and spruce. All these trees flourished during the first Interglacial Period. Only the hardier *flora* and *fauna* survived later hardships. All over Europe the forests and the meadows were teeming with wild-life. In truth, as John Heywood says,

Fieldes had eies and woods had eares.

Such, in brief, was the environment of our early ancestors.

The effects of climatic phenomena on human beings during Glacial and Interglacial Times have engaged the attention of many thoughtful minds. The multiple Glacial Stages were accompanied by multiple climatic changes, the successive periods of which conditioned the *flora* and *fauna* of Europe throughout the long age. Beds of fossil plants and bones of mammals, glacial moraines and "drifts", and succeeding "river-terraces",—all these tell the story. And because the wisest man that ever lived is not always right, there is divergence of opinion among savants as to the number of Glacial and Interglacial Periods. The prevailing opinion is there were eight; but the exact

number is not important to our present purposes.

These divisions taken together form the most interesting age of the ancient world. For it was during this great Ice Age that the cultural relics and the skeletal remains of primitive man were deposited. On these deposits are based vital parts of our study. The duration of this epoch therefore is important. Authorities differ from 800,000 to 100,000 years; but the conservative estimate of Penck is now generally accepted. This gives us an approximate period of 525,000 years "since the first great ice-fields developed in Scandinavia, in the Alps, and in North America west of Hudson Bay".

Since the grand divisions of time are marked by certain large geologic agencies forever at work, the comparative ages of the various camp-sites of prehistoric folk are determined, first, by their geologic succession; second, by the imbedded remains of mammals and plants; and, third, by implements and other relics of cultural types of industry.

The Old-Stone-Age man was induced to dwell where game was abundant and where the raw material for his meager industries was accessible. Something ever brought him back to his old camping-grounds. Perhaps it was "the musty reek that lingers about dead leaves and last year's ferns", in the words of Rupert

Brooke. It was at these sites that prehistoric children first noticed that wet pebbles were rich for an hour; and there it was that lovers first noted the gleaming raindrops in the cups of flowers. At any rate, where woman laid the hearthstones is written much of the strange tale of primordial human life. But other records also were left. Now and then in the "river-drift" are found vestiges of man's skeletal remains, and oftener the relics of his industry. In time and the fulness thereof, as love evolved the funeral rite and appointed the burial place, his relics tended to assemble. The implements of his make, less perishable than his bones, were widely scattered; some are found in "river-drift" and "river-terrace"; others on the plateaus and uplands of the "loess" stations. Chronology therefore must be determined by geologist, archæologist, anatomist, anthropologist, and the rest,—all working together co-operatively. Then the inspired savants, with the enthusiasm of genius, weave the whole into a fabric that constitutes the fascinating story of prehistoric life and times.

The caves, scoured out in early glacial times by subterranean streams heavy with grit and gravel, became relatively dry in later epochs. Yet their depths were not generally inhabited, owing to poor ventilation, as indicated by the old hearths that almost always are near the

entrance, just inside or just without. Instead of cave-life, it was grotto-life. The primitive hunter-tribes were ever in love with the open regions where they followed a roving life as free as the winds. They made their camps however in sheltered places during the inclement seasons. The deep cave-recesses were reserved probably as prisons for captured women, and later perhaps as headquarters for artists, priests, and magicians.

The geologic technic in cave-construction was efficacious in smoothing the walls and in carpeting the floors with fine loam. The Magdalenian artists probably made their first drawings in this cave-loam; and now and then, as for example in the Tuc d'Audoubert, they made use of this material as modelers' clay. The smooth, often polished, walls were used in an early day as drawing-boards, and finally to receive the paintings of the Upper Palæolithic artists.

So much depends from point of view that I often wonder what should be regarded as a standard in looking at anything. In the contemplation of prehistory, the time-scale is the epoch marked by geologic changes in the skin of the world, by climatic conditions which bathe it, and by evolutionary stages in the progress of life: a progress dominated by some mysterious force surrounding the habitable globe—an epi-

phenomenon governed by a strange mandate that forces life to bruise and to break living beings in order to continue.

In dealing with prehistory, one must treat a continent as he might treat his garden; that is to say, he must note all the changes through the round year. The difference is this: the prehistoric year is multiplied in the conception of the prehistorian by 525,000. His spring begins with the Eocene Epoch, when mammalian life swarmed over the continent of Western Europe—life that was "indigenous to every continent on the globe except South America and Australia, and adapted to every climatic life-zone, from the warm and dry plains of southern Asia and northern Africa to the temperate forests and meadows of Eurasia". Some came "from the heights of the Alps, Himalayas, Pyrennees, and Altai mountains"; others from "the high, arid, dry steppes of central Asia, with their alternating heat of summer and cold of winter"; others came down "from the tundras or barren grounds of Scandinavia, northern Europe, and Siberia"; and still others from "the mild forests and plains of southern Europe".[1]

Thus the prehistorian visualizes this swarming life; and he marks its variations through succeeding epochal seasons. He notes that the

[1] Men of the Old Stone Age (Osborn).

successive groups of our Palæolithic kind fed upon these mammals, used their bones for implements and their skins for clothing; and that in the course of time these utilitarian objects became artistic subjects of æsthetic taste capable of high development.

This æsthetic development based on the most utilitarian pursuits of early man is a sign, little in itself, pointing to large things. It makes possible those fine deductions that carry with them in some way an atmosphere of poetic fancy to soften the sharp angles of realism and to render alluring a realm which is so weirdly remote.

Having now the human being with his nature and powers well established and defined, we see him environed by climate and *flora* and *fauna* in no respect remarkably strange to his descendants to-day. Knowing that he was in the earliest stages of education, we are able to visualize the nature of his struggles for existence, and to see just what powers of his mind and body were exercised to their fullest extent and keenest intensity. With this as a basis, we may follow his æsthetic development through the various stages of his art, and thus may we catch glimpses of his soul in its unfolding.

Nothing else so clearly reveals the soul of a people as does their art. Science and mechanics

are purely intellectual. Commerce is the flux of acquisitiveness everywhere extended. Economics is a philosophy founded on the predatory instincts of man. Statecraft is a working-theory to make the philosophy seem plausible. Politics is the brutal application of that theory. But the æsthetic impulse bursts from the emotional nature of man. This impulse is one of the earlier signs of man's superanimal destiny. Artistic vision is an innate faculty of mind and spirit; and the inborn urge to create and to perpetuate enjoyment precedes the powers of representation. Art is destined to reveal a sense of proportion in which beauty dwells; to welcome the advent of morals, because morals is the flowering of spiritual beauty; and at the same time it is destined to discover the charm of form and color.

Art in Europe may be traced from early Aurignacian times, and it may be continuously followed until the close of the Magdalenian period. The dominant racial group of that epoch is believed to have been the Crô-Magnon. Dr. Osborn regards this people as the "Palæolithic Greeks". From the beginning, their art shows on the whole an unbroken evolution.

Lartet was the first to discover this art; and the investigations he started were continued by Piette, Capitan, Sautuola, Cartailhac, Breuil, and others. It ranges from *l'art mobilier*, con-

sisting of the embellishment of ornaments and implements of stone, bone, and ivory, to *l'art parietal* which covers "drawings, engravings, paintings, and bas-reliefs on the walls of caverns and grottos".[1] Breuil proved this art to be homogeneous and progressive in its development. According to Osborn, it forms a key to the psychology of the racial group not only, but it becomes another means "of establishing prehistoric chronology".

Considered as a means of determining the comparative chronology of the times, a study of this art is invaluable as giving the rough date of execution "by the archæological layers of succeeding periods". The stalactite formations that have required thousands of years in which to close the entrances of galleries in caves, are sufficient proof of the antiquity of the art found in those galleries. There are also frescoed ceilings that have been buried since "long before Neolithic times . . . by the closing up of the entrance" of the cave. Again, there is the similarity of characteristics shown "in the engravings on bone, found in the old hearths, associated with flints, to [those of] the mural decorations which are found upon the walls". There are still other means of determining the chronology as, for instance, the superposition of design, the type of the animal depicted, etc.

[1] Osborn.

A careful examination of the art shows that it proceeded gradually from childlike powers of observation to those as adequate as any possessed by ourselves. The artistic impulse of this people found outlet through many different fields of achievement. There were engravings on bone, stone, and ivory; the fashioning and the carving of the same materials range from the crudest attempts at sculpture to fine effects in bas-relief, mural drawing, geometric decoration, and painting.

Aurignacian figurines carved from soapstone throw sidelights on the life of the times. The male figures indicate that the men followed active, athletic pursuits; while the female figures show a corpulency resulting from a sedentary life and a diet of fat and marrow.

The delineation of animal forms naturally began at a very early date, before attempts were made to depict the human form. The first indications of painting lead to ancient Aurignacian times. The efforts in this direction were confined to crude outlines; later the outline drawings were filled in with color. All through these designs and paintings may be found evident attempts at close observation and realism of effect produced by relatively few lines, together with vital suggestions of the spirit of action. As draughtsmanship developed, characteristic features were seized upon and em-

phasized, showing not only the power of accurate observation but an artistic sense of a high order in the designer. Slowly but surely the human *motif* became more important to the mind of the artist than that of the brute figure.

A fact bearing on the speech-area of the brain already referred to, indicating that its location at that time had been established in the left hemisphere, is found in the many right-handed tools recently discovered, such as crude flint saws, picks, chopping instruments, stone planes, burins, and so forth.

During the long course of artistic unfolding, the effect of climate, which produced changed habits of life, bears upon the art-product of these prehistoric groups. Apparently, during the Solutrean times when the people were accustomed to live more in the open, the art-impulse slackened, to become taut again under the more rigorous climate of Magdalenian times as the people were driven back to cave- or grotto-life.

The Crô-Magnon group probably produced the art of both Aurignacian and Magdalenian times. The Solutrean culture reached Europe from the East; its origin however is as obscure as that of the Crô-Magnon. There is some evidence of Solutrean advance over Aurignacian art in decorative and geometric effects. But Magdalenian art interests us most because it

reveals "the culmination of Palæolithic civilization"; because "it marks the highest development of the Crô-Magnon race preceding their sudden decline and disappearance as the dominant race of western Europe". Furthermore, according to Osborn, "The men of this time are commonly known as the Magdalenians, taking their name from the type station of La Madeleine, as the Greeks in their highest stage took their name from Athens and were known as Athenians."

It seems to be well established that the early Aurignacian art movement culminated during Magdalenian times when it reached its apogee in sculpture, engraving, and painting. Its uniform character implies that it was done by the Crô-Magnon group.

The Magdalenian artists, being accomplished realists, must have come into close contact with their subjects since they rendered them so well in action and form. This is notable in their treatment of bison, horse, mammoth, reindeer, rhinoceros, lion, and bear. The decoration of living-utensils also shows a high state of artistic culture. Whatever the cause of the incomplete arrest of art during Solutrean times, its revival during the Magdalenian is obvious in many forms, including that of the human figure.

The two leading interests of those times seem to have been the chase and the cultivation of

art. Mysterious caverns were converted into picture galleries. The æsthetic impulse was intensely active. Certain beautifully carved implements called "bâtons de commandement" suggest tribal organization of an advanced stage. Then as now, there was diversity of temperament and of talent. This diversity always produces social differentiation. There were hunters, priests, chiefs, artists, manufacturers, dressers of hides, and primitive tillers of the soil.

As the intellect developed, the sense of wonder grew. The phenomena of nature attracted first the emotions and later the thought of man. This partly accounts for the dim birth of religion; for religion is, among other things, an emotive outlet for wonder and awe. From the sense of wonder the gods were born, just as ghosts issued from dreams, just as angels sprang from hope and evil demons from fear. The sense of grandeur aroused ideas of the supernatural; and the sense of curiosity led early man to explore the depths of caves and the unknown regions of forest and sea. Music and poetry, formerly one but now widely divergent, came from love; and the idea of a spirit possibly had its origin in the shadow. The craving for an explanation of natural occurrences let loose all manner of vague notions and a host of superstitions, many of which re-

main with us. For we still are living in the morning of humanity. The noontide of our race is ages and ages away. The burial rite probably originated in the hope of another life.

The artists of those far-off times delineated upward of thirty varieties of mammals. We know that they had before their eyes a vast array of animal life, many forms of which they depicted with vigor and skill. There were the tundra animals: mammoth, woolly rhinoceros, reindeer, musk-ox! from the steppes were horses, antelope, asses; Asiatic life gave to them the lion and the desert horse; in the Alps were ibex and chamois, in the meadows, bison and wild cattle; roaming the forests were red deer, stags, forest-horses, cave-bears, wolves, wild-boars, and the moose. It is highly suggestive that the artists were attracted more by animal subjects that possessed fine lines and pleasing proportion than by the others,—a favorite being the majestic bison, or the graceful horse.

Returning to climatic influences: It is quite certain that as the climatic conditions became harder the artistic traits of the Crô-Magnons were stimulated and, as naturally would be expected, both physical and mental development became more rapid. The imagination seems to flower in physical hardship, and its roots always are found in the home, whether the home

be a natural cave below ground or one artificially constructed above; and better than all else, the home must contain a hearth presided over by a woman.

The people of Magdalenian times certainly had stone vessels for holding water, stone mortars and pestles for grinding mineral colors. They engraved ivory tusks and made wonderful harpoons, flint augers, burins, polishers, bone needles, flint saws, and stone lamps. According to Barthelot, animal fats were burned in the lamps.

The methods of some of the later Magdalenian artists were similar to those of to-day; that is to say, first a sketch or design was made, to be followed with the painting. Primordial realism slowly passed into a form of impressionism which was executed with the least number of lines. The spirit of Magdalenian art was as "modern" as that of Barbizon.

The foregoing leads to a very important feature of prehistory: that is the relation of woman to the earliest known art. This feature never has been recognized fully by any authority on these matters. It has been assumed, always tacitly or otherwise, that the prehistoric artists were men. This assumption is natural enough to one who has in mind the art-development of the last two or three thou-

sand years. But during this relatively modern period, conditions under which art developed are so entirely different from those of remote prehistory that analogy between them breaks down.

It seems altogether probable that woman was the first artist. The conditions of her life were favorable to the development of an artistic temperament, to use a trite expression, ages before man had time to think of much else than the chase and war. As we have seen, the life of woman was more solitary than that of man. We know that the child (quickly reproducing the childhood of its race) is given to "making pictures". The solitary child, particularly, finds its chief amusement in the drawing of crude outlines. It uses colored materials when it can; but when it can not do better, the child resorts to scratches, making use of any material within reach.

Primitive woman, probably was a keener observer than primitive man. Her life, as his, depended on powers of observation; but what was more important to her than life was the life of her child. Thus a double stress was imposed on her powers of observation. Besides, she had greater opportunity than man, during her enforced periods of solitude, to turn toward artistic employment. She had learned to make baskets and to daub them with

natural tar. Already she was producing crude handicraft objects. She knew how to scratch in the earth and other soft substances to convey information to a chance passer-by. It was now only a step to the making of drawings on bark, stone, and bone. From her earliest utilitarian signs and marks to playful caricature was another step. From this to the æsthetic drawings on the walls of caves, on loose stones, on tusks and bark, was only another step; and that step I think she made.

Figures of women are relatively scarce in the examples we have of the art of this period. This is exactly what would be expected if the artists were women. The mysterious lure of sex inspired the early delineators with dreams of their sexual complements. These dreams seek concrete expression. Naturally, the women artists would be more concerned with the male figure; and for that reason, where the human form is outlined, it usually is the lithe, athletic form of man. Where we find the figures of women represented, they are fat and they have the maternity features grossly exaggerated. Both in outline and in modeling, the figures clearly indicate that woman was of sedentary occupation. The point is that the sedentary life favored the artistic pursuit then as it does now. At any rate, those who had the leisure were more likely to have been artists than those

who were engaged more or less continuously in the strenuous pursuit of game or the arduous pursuit of warfare.

When these early folk began to occupy the caverns, the deeper recesses probably were at first used as prisons for women captives. Confined in these retreats, they were easily guarded. During long periods of idleness, it is natural that they should turn to the adornment of the cavern walls and to other artistic occupations.

"When men first crept from out earth's womb, like worms,
Dumb speechless creatures, scarce with human forms,
With nails or doubled fists they used to fight
For acorns or for sleeping-holes at night;
Clubs followed next; at last to arms they came";
And meanwhile longing taught them how to frame
An intuition vague with boundary-lines;
And then the love of mimicry entwines
With loftier imagery, until the heart
Of prehistoric man sowed seeds of art
That found congenial soil in bark and bone,
Took root in sunless galleries of stone;—
Thenceforth a vine crept round the smiling earth
To bear the blossoms of benignant worth.[1]

[1] The Philosophy of Painting (Bell).

WOMAN IN THE BORDERLAND OF HISTORY

THERE is no evidence that primitive woman was inferior to primitive man. The differences in sex that effected divergence of mental trajectory, emotive cleavage, and a division of labor gradually forced woman into bondage. She became degraded in man's eyes and, what was worse, in her own.

In savage states of society the helplessness of the weak arouses the cruelty of the strong. The period of gestation, the temporary preoccupation of childbirth, and the necessary care of the young compelled woman to seek protection and aid from man. Brutality and strength went hand in hand. Weakness and slavery were companions. Primeval barbarism was long-lived.

Hunger was man's first god; and the seeking of food was his earliest religion. Pillage was the ambition of our ancestors; warfare was their glory; and the Great War might imply that yet there is some ethical progress to be made by their descendants.

Early man's aspiration did not rise much above his amatory desires and the taste for a few rude comforts. Whatever he perceived to be of service to himself, he used with little regard to the rights of the others. The things that encumbered him in his march through time and its wildernesses, he discarded. The weak and the aged, crippled and female children were killed or abandoned. The robust women, necessary to his well-being and useful as slaves, were kept as chattels. As recently as in Spartan times, the remnants of some of these hard customs trailed the march of civilization. The indifferent attitude of the Greek mind toward unfortunate children however was modified by ideals of bodily perfection; and these ideals were transformed into art.

Woman staggered for ages under oppression. She was the common property of the tribe,—in no sense the mistress of herself. The tribe was the father of her children; but the mother was responsible for their care, and for that reason perhaps primitive justice perceived dimly that the child should belong to the mother. This was in effect a victory for womanhood. Many ages later, society recognized that the right of inheritance by the logic of succession should depend from the female line. Long afterward when this view of natural justice became ob-

secured, the pendulum of woman's rights swung backward.

Marriage maybe was the second victory unconsciously achieved by woman. It may have been only a Cadmean victory; yet it was a great step from the state of being the common property of the clan to a state of marriage, however low the form of union. This acceptance of *unity* in the mating of men and women, tenuous and tenebrous as it was, nevertheless was a momentous event in the trail that primeval people were blazing toward a civilization that we moderns still pursue afar-off.

When marriage had become a custom generally recognized in later epochs of prehistory, the dawn of civilization was breaking. The *home* had appeared on earth; the roof-tree had reared its symbol above the hearth. A spiritual synthesis, like an altar-flame, burst forth to warm the heart with love.

Woman, who long had stood between man and the uncertainties of the chase by cultivating the soil; woman, who had stood between man and the misfortuntes of war by guarding his fiocks; woman, who always had stood between man and extinction by the bearing and the rearing of his children,—woman at last was able to stand between man and the inclemencies of life by making a home for him. Through servitude she had become the mother of art. Through

love she became the mother of everything worth while.

Motherhood, the chief benefactor of man, was the severest slave-driver of woman. Motherhood made her a physical slave, and in later times a legal idiot. Through æons of servitude shackles were riveted on her mind. Through love she became the wife of man, the mother of virtue, the fount of the spirituality of our race. Through all the stages of motherhood, from the lowest physical to the highest spiritual, she has paid a penalty for every benefit she has bestowed upon us. In every way the peer of man, her gifts, duties, sacrifices, servitude, and obligations to humanity have withheld from her sex in the past the opportunities to reach man's intellectual level. Only in spirituality, during the dim ages gone, has woman been permitted by Nature and Fate, or God and Man, to lead in progress. Otherwise and always, until most recent times, she has pushed the van of civilization so that those who rode in it might dream of some joys in this life whilst she walked behind blinded by the sweat of toil and the dust of the road. Her only consolation was the hope of a life to come in a better world.

From the unknown period of man's earliest domination over woman, down to recent times, he has maintained arbitrary authority over her

person whilst taking ever subtler liberties with her soul. He kept her in physical confinement or in the prison of pious fear. He called to his aid all the superstitious elements of religion. He forced her to suppress her natural desires. He told her childish tales, and he fed her mind with impossible precepts until she acquired intellectual dyspepsia, which threatened to become chronic. He educated her so thoroughly in nastiness that she became puritanical. She was ashamed of her natural parts, acts, and impulses. Ideas of sex grew to be abhorrent to her or, following the rule of reaction to extremes, she became sexually engrossed. He filled her mind with dread lest she offend God with the physical pleasure and the spiritual joy which abide in the house of love. He did his unwitting best to make her thoughts obscene. He converted her into a plaything of his lust, and he trafficked in her charms as he traffics in beef-on-the-hoof. For ages, man's conduct was public conduct and his opinion, public opinion.

Now all these oppressive acts were interwoven with kindly motives. Many stupid men, perfectly honest, believed that fear was the only safe foundation of virtue, and that ignorance was a bulwark against sin. The whole weft of social progress is purple-shotten and mingled with threads of pure gold. The shuttle passes from epoch to epoch. Strange patterns are

woven—the beautiful together with the hideous. In the broad course of racial advance, retrogressive movements parallel the progressive. Our hope lies in the forward tendency of the general current.

The flux of time brought woman to another stage comparable to victory. This gain modified her defeat in the loss of succession, in the line of descent. An important factor in her new status was the legality of monogamy, which already had received ecclesiastical benediction. She became the *recognized* mother of her lord's heirs. Through her he dreamed of posthumous glory in his sons. Through her he lived again. Through her he kept an avaricious grip on his gold by passing it along to his children. Woman had acquired the dignity of definite and concrete worth.

Virgins now could bring high prices to their sires, position and jewels to themselves. This legalized form of sanctified prostitution has not yet passed away. But such things do not shock us who so love the Bible that we can not discriminate between what is recorded and that which is taught in its pages. According to this venerable book, there is slight occasion for pride in pedigree. Considering our ancestors, we are getting on. If Leah and Rachel were sold to Jacob for service, why may not Ella or Jane be exchanged for position and power?

Mrs. Mill, in her "Enfranchisement of Woman", says: "That those who are physically weaker should have been made legally inferior, is quite conformable to the mode in which the world has been governed. Until very lately, the rule of physical strength was the general law of human affairs. . . .

"The world is very young, and has only just begun to cast off injustice. It is only now getting rid of negro slavery. It is only now getting rid of monarchial despotism. It is only now getting rid of hereditary feudal nobility. It is only now getting rid of disabilities on the ground of religion. It is only beginning to treat any *men* as citizens, except the rich and a favored portion of the middle-class. Can we wonder that it has not yet done as much for women?"

This is too modern. Let us go back for a moment to the ancient Hellenes. The lament of Iphigenia shows how woman was regarded in those cultured times: "The condition of woman is worse than that of all other human beings. If man is favored by fortune, he becomes a ruler and wins fame on the battlefield; and if the gods have ordained him misfortune, he is the first to die a fair death among his people. But the joys of woman are narrowly compassed; she is given unasked in marriage, by others, often strangers, and when de-

struction falls upon her house, she is dragged away by the victor."

We have read how Penelope was ordered about by Telemachus; and that he had authority even to give his mother in marriage. We are familiar with the command of the sacred Talmud which says: "When thy daughter has reached maturity, set one of thy slaves free and betroth her unto him." By a thousand similar records and traditions we realize how long human nature has been loath to change for the better.

Solon, the giver of laws, was praised by a contemporary at Athens in the fifth century, B. C. in these words: "Solon be extolled! for thou hast brought public women for the safety of the town, for the morals of a town filled with strong young men, who, but for thy wise institution, would have given themselves up to the annoyance and pursuit of women of the upper classes." Even the iron-tongued Demosthenes said: "We marry in order to obtain legitimate children and a faithful warder of the house; we keep concubines as servants for our daily attendance, but we seek the Hetæræ for love's delights."

I shall refer to St. Paul and others of his ilk later. Mark the words of Thucydides: "Woman is more evil than the storm-tossed waves, than the heat of fire, than the fall of the

wild cataract; if it was a god who created woman, wherever he may be, let him know that he is the unhappy author of the greatest ills." Thucydides fared badly in love. The unhappy author of his ill, or somebody else, bungled him in the making; and bungled lovers always are all vinegar toward women.

The garrulous Cato advised the heads of Roman families to be more rigid in their treatment of wives; to keep them in a state of "proper servility" in order that wives and mothers should not become public nuisances. This is the attitude of male "antis" to-day.

Well within the border of authentic history, the feudal system, with its military ideas and ecclesiastical traditions, exercised under the "rights of seignory" a monstrous tyranny over women. Not only did these "rights" comprise a jurisdiction that is unprintable now to define, but even the power on occasion to deprive women of life itself.

The vaunted deeds of chivalry inspire us with little admiration. Chivalrous indeed were the times when a shapely horse might compete with a beautiful woman; when a man might legally cudgel his wife for infidelity and beat her for contradicting his statements or for differing from his opinions! We read that if the woman will insist on her views she shall be

"struck in the face till the blood comes". Such flowers of chivalry are innumerable.

In the half-lights of history, feudalism takes on the colors of romance. In fact, much of the romance is false. The age was savage and superstitious. It was filthy, violent, brutal, and barbaric. Nearly all its poetry celebrated adulterous love. The troubadours rarely sang to innocent maidens; the minstrel knights seldom addressed their lyrics to the love of unmarried women. Indeed, mediæval literature struck a higher note and a purer tone only after the middle-class freemen of the cities became strong enough to be independent and wealthy enough to develop a culture of their own. Only after that did women begin to win honorable position in society during the Middle Ages.

Almost any kind of violence however repulsive may be transformed into a ceremonial custom if it is practiced long enough to acquire a venerable cast. Rape is a notable instance. Following the decline of woman's wooing—when she ceased to be the woo-man of some prehistoric age—force and capture became the custom. This practice of the male is so old, in one form or another, that the female rather expects it. At the first embrace, most women are disappointed if they are not subjected at least to some euphemism of force. The very nature of woman was modified by this kind of vi-

olence until a new element arose in her psychology. This is known to the students of erotic tumescence or the phenomena of sexual tensions. The psychologist knows that this act of violence on man's part has its complement in woman's modesty, among her other complex emotions. Some factors of her modesty are older than our race; and all the factors intermingle or blend in her sense of decorum; some are indicated by her gestures; others have their roots in the fear of personal injury, in disgust and reprobation. We observe also that jealousy in woman's nature is allied to, or parallel with, a streak of brutality in man's. Both in men and women, jealousy is related to strong amatory impulses poorly governed by a weak will under which low-grade thought is in gurgitation.

Romulus, as we read in Ovid, represents not only "a true king", but also man's attitude for many centuries toward woman:

> "Providing Sabine women for his braves
> Like a true king, to get a race of slaves."

The incident of the Sabine women is a classical, as that of the Belgian women is a sordid, example known to all. At the present time rape is symbolically, if not always actually, performed very generally over the world in the consummation of marriage. Even amongst the

most cultivated of peoples, the marriage-bed too often is "for joys of matrimonial rape designed".

For ages, woman was fair booty in war; for ages, only her brothers inherited from her father; for ages, the birth of a girl-baby was almost a calamity in a family; for ages, only her brothers were educated; for ages, she was taught chastity and forced to be impure; for ages, she was given in marriage against her will; for ages, she was compelled to earn her bread in her own family by the most menial of work; for ages, the wife was subject to the husband in body and soul; it was his "right" to chastise her and otherwise to violate her person—to humiliate her and, as I have said, even to take her life.

Man has cheerfully thrust woman into prostitution and then, in the hypocritical indignation of his soul, he proscribed, tortured, and otherwise punished her for the act. He always has been a true believer in vicarious atonement. For many centuries the economic dependence of woman on man has been almost absolute. During long ages it never occurred to him that woman had a right to economic equality, to equal opportunity for full development, and to free and equal choice where her happiness and well-being were at stake.

And so, whenever I read pharisaical homilies

on the sins of prostitutes it makes me sick. And whenever I hear of woman's "unfaithfulness" I can not help feeling something akin to delight in that kind of crude justice. For it seems to be only an evening-up in the fitness of things—a kind of poetic righteousness which shears the sheep that set out to gather wool. Not that I wish to encourage adulterous love, but I can no more weep over woman's marital infractions than I can gloat over man's. It is a bad mess all around; but I can excuse the woman a little more easily than I can pardon the man.

Woman ought to be tired of bondage, tired of flattery, tired of sentimental nonsense, and of sexual patronage; and she is beginning to show her disapproval of such treatment. Surely, it is high time that her personal dignity should give the lie to such twaddle as this:

> "By flatteries we prevail on womankind;
> As hollow banks by streams are undermined."

From the strength of man's "passion" and woman's "weakness" arose the various sex-cults. The superstitious elements of religion aided man in his acts of conscious and, more often, unconscious oppression of woman. False religion helped him to enslave and to degrade her. Behind the mask of "consolation", religious superstitution has ever been her most

insidious foe. It has been her worst enemy because she was taught to regard it as her best friend. She is most under the spell of dogma when she is least capable of belief. The paradox clears up when we realize that most women, and men too for that matter, *think* they believe this or that when in truth they indulge only slavish notions implanted by authority. For it requires free and keen mental powers to appreciate the nature of belief, or to analyze its processes. The practical application of its processes therefore is necessarily restricted, but not necessarily to the priestcraft.

We see the evil influences of sex-cults bearing on woman in the East from prehistoric times. We see the virgin driven to the Temple of Mylitta to be ravished by the loitering horde of human boars and lascivious goats. Down through Phœnicia, Syria, Carthage, Egypt, Greece, and Rome we can trace the same degrading rites and customs practiced in the name of religion; and nearly all of these rites tended to debase woman.

The evils of vicious superstition were common among the Jews in Bible times; and similar evils have flourished among other tribes and peoples over a large part of the world almost ever since. In "the good old days of the old-fashioned woman", the acme of hospitality

was the giving of wife or daughter to a visitor for the night. No doubt there are many today who in their hearts would welcome a return of those dear old times; but the development of what is best in womanhood does not proceed in that direction.

No human being gives forth its best in slavery. Perfect freedom, of course, is possible only to the enraptured disembodied soul in a salubrious climate; yet practical freedom should be possible to corporeal beings in civilized society. Freedom does not countenance license in sex-privilege nor in any other. But there should be no "mortification of the flesh" in one class and a glorification of the flesh in another class of human beings. Equal rights should be the rule; for where there are equal rights to every opportunity, there also is freedom.

The inconsistency of man's age-old treatment of woman would be ridiculous if it were less harrowing. From Solon down to the crazy Otto Weininger, her sex has been discriminated against with force and diatribe. The old lawgiver encouraged prostitution, as we have seen, for the benefit of Athens' "strong young men"; and whilst he made it legal for man to degrade woman, he made her degradation punitory. His laws called for her imprisonment, slavery, or death when she broke her vows to a brute perhaps for the man she loved but could not marry.

The essence of this identical injustice is alive all over the Christian world to-day, and it is nurtured by priestcraft in the name of religion. Its iniquitous vitality can be accounted for only by the barbarism that still is in us and by the fact that lies are, and ever have been, the most respectable factors in our system of civilization.

Il y a quelque chose de plus parfait que l'homme parfait, c'est la femme parfaite. All real men admit that; yet the blade of chivalry is not bright enough to maintain that barbaric traits exist only in the nature of man. The female part of our race has, and always has had, its full share. The wonder is that woman should have made such amazing progress in spiritual and material development under her enormous handicap.

Man has erected temples and built shrines to his lust while woman has created the sanctuaries of love, called homes. The lowliest home made sacred by a woman's love and the laughter of children does more for civilization than the fairest temple ever erected to the Hetæræ or the finest cathedral that ever was builded to God.

The religious symbolism of Motherhood, as exemplified in Mary, outweighs all the good to be found in the symbolism of Aphrodite, Astarte, Venus, Freya, and others of the same

genus; or of Phryne, Lais of Corinth, and other notables in "love's delight" whom Mary supplanted at the rise of the new religion.

The laws of Solon, in so far as they were humiliating to womanhood, were a curse to mankind. The Julian law of Augustus was no better because, while it provided for children, it did nothing to elevate the moral tone of marriage; and the monstrous modification of that law by Tiberius transformed it into a moral thumbscrew and rack in the hands of the Ædiles. Indeed, a strange retrospect is furnished by the laws made by men for themselves and those that they fashioned for their women. The lawgivers for the most part were spiritually blind and stupidly cruel. For every misdeed toward woman is a sword that cuts him who strikes, even as it wounds her upon whom the blade falls.

Athens, it is true, had its "Golden Age"; but even at that time the better nature of woman was constrained from all except the gilt. The female sex was not permitted to participate as much in the development of civilization as it was forced to corrupt public morals. Little value was set on chastity. With propriety a guest could outrage what we conceive to be the principles of hospitality; and with impunity he could violate the higher laws of nature. Among some of the Gnostic sects,

the wife was freely lent to any filthy old tramp of the Order while he remained a visitor in the house. Gods were given all the infirmities of men; priests and priestesses were corrupt and lecherous. Yet the fame of Penelope, Andromache, Helen, and Hecuba tells us that the Greeks saw clearly into the nature of woman with its good and bad traits, and that they often celebrated her at her best.

The kidnaping of women, and their subsequent treatment, stare coldly from the pages of Homer. Polygamy was common. Polyandry was permitted by the Code of Lycurgus to the most beautiful of the Spartan women, which proves that the Greek mind, seven or eight hundred years B. C., harbored some seeds of justice.

The Athenian women were wielders of physical force—believers in public violence and personal vengeance. Their fits of passion bordered on madness; yet countless Greek women of that day were ideal wives and mothers. At that time the Hetæræ held strong social sway; and they exercised an influence over the most enlightened minds of men, as their successors in the sterile art have done ever since.

In China, Tartary, Thibet, and Japan women were especially debased. Wives were bought and sold, harnessed to hard labor, and rewarded with harsh treatment. In Japan, woman plays

virtually no part in history. The Hebraic laws, heavy enough, were less galling to her shoulders than those of the Buddhists which surely were not light. The records of Miriam and Deborah, and a few of the less doubtful of the Sibylline verses, indicate that women in ancient times took some part in religious matters and that they were influential in secular affairs. The early Israelites however were prone to disregard woman's natural dignity and to trample ruthlessly on her natural rights. Incidentally it may be mentioned that their widows were clothed with sackcloth and "shirts of hair", even when well rid of worthless husbands.

In India, the priests devoted young daughters to the abominable service of the Shrine. Here women were active in religious ceremonies; and here always were they preyed upon by disgusting idolatry. They were crushed by the Juggernaut, drowned, buried alive with corpses, burned on funeral pyres, tortured by caste, married as infants, and generally bedeviled beyond belief. Owing to the submissive nature of their women, Hindu marriages often turn out well. Despite the brutality of their treatment and the iniquity of the marriage customs, the women for the most part make good wives, if conjugal worthiness may be expressed in terms of servile degradation. "The horrid rites of idolatry", according to Fullom, "the

wicked devices of superstition, the monotony of a secluded life, and a long course of barbarous usage, have, in their case, failed to deface, however they might distort, the beautiful lineaments of the female character, and almost every action of their lives attests an abnegation of self."

As a rule, in pastoral ages women perform the menial tasks. They tend the flocks; they make the wool into garments and the hides into many useful articles. Women are beasts of burden—the hewers of wood and the drawers of water. Their clothing and personal ornaments are prescribed. They are kept in separate lodgings, like cattle. They are ravished without the slightest consideration. They have nothing to say about marriage or divorce; and, of course, nothing as to the number of children they must bear. Job's description of the Troglodytes might almost be used as a finishing touch to the picture.

Now and then the rule has an exception. Among the early Egyptions, who were a pastoral people, women fared better. They were permitted to share in the fruits of civilization, such as they were, to some purpose; but on the whole, women were subordinated, and as times grew worse, they were degraded.

During the flower of Egyptian civilization, womanhood arose to a state of true dignity.

The Code of Hermes was so liberal that it acknowledged many of women's natural rights in a light that is regarded as modern. It favored monogamy; and it provided equally for the equities of husband and wife. The standing of a princess was as high as that of a prince. Thermuthis, daughter of Rameses the Great, is an example frequently mentioned by authorities, and the example is not solitary.

It is true that the marriage customs of the Egyptians are more or less obscure; but it is known that the rights of wives were clearly defined and generally accepted. Ties of consanguinity, it appears, were no barriers to wedlock; otherwise the marriage laws of this people were commendable.

Jewels were much worn by the women; gloves were in use; and the appointments of the toilet reached their rarest refinement. Luxurious, perfumed baths, love of flowers and fine raiment, careful attention to personal hygiene—all show a high order of society. Free social intercourse took place between the sexes, from the highest stratum to the lowest, excepting only the swineherds. Woman took part in public functions, except those of the heirarchical religious ceremonies which, as usual, were conducted by the men. But subordinate sacred offices were filled by women, who also were employed as *accoucheuses* and mourners. Female

chastity was esteemed; and the Seventh Commandment of the Hebrews was Egyptian statute law. This law however was one-sided—it was made only for the women. She who broke it forfeited nose and ears. The same "irregularity" was easy on the person and no doubt on the conscience of the man.

With the wane of Egyptian civilization waxed feminine sorrow. Women received less and less consideration. "Their treatment", history says, "grew every day worse, keeping pace with the decline and corruption of the nation, till, at last, we behold woman enduring cruel punishments, which modern justice withholds from the vilest female criminals. At one time she is publicly beaten with a stick; at another, loaded with overwhelming burdens, buried in a dungeon, or sent to work at the mines—not, as might be supposed, for any guilt of her own, but in expiation of the crime of a brother, a husband, or a father. Diodorus has drawn a touching picture of her sufferings at the mines. 'No attention', he observes, 'is paid to her person; she has not even a piece of rag to cover herself; and so wretched is her condition, that everyone who witnesses it deplores the excessive misery she endures. She is allowed no rest or intermission from toil: neither the weakness of age nor woman's infirmities are considered; all are driven to their work with the lash,

till at length, overcome by the insupportable weight of their afflictions, they die in the midst of their tasks: so that they long for death as far preferable to life'."

It would be a prodigious task to describe woman as she was in the borderland of history, with its shadowy traditions. About the best that can be done is to give glimpses of her station as it appears here and there at earlier and later times. But what she was, she no longer is. Even briefly summarized, her achievements challenge the thoughtful consideration and the admiration of mankind. As we look at the shifting mirages of the terrible centuries dead, we dream hopefully of the future. Seeing what has been done, we foresee partly at least what may be accomplished.

Woman domesticated man, and she started him on the road to civilization. With the advent of war, she had all the work to do. As I have said, she became an adept in homecraft and in the arts of peace. Some of her inventions have been mentioned. She taught herself to weave and to spin, how to make clothing for her naked babes, how to protect herself from the weather. She invented the potter's wheel, the distaff, and fibrous cloth. Many centuries ago her Carib sisters were cotton-planters, and they manufactured cotton goods. At the same period men were engaged in huntcraft and war-

craft; they were inventing implements of destruction, modes of enslaving, predatory methods, and the various arts of quarreling, of reprisal, and of punishment.

By establishing the home, by developing agriculture and the arts of peace, woman contributed the most important elements of civilization. During some of the pastoral epochs, she even reached a station of comparative ease and comfort. Man relieved her of some of her burdens—protected, and helped her to feed her children. Now he was more regularly occupied than during earlier days when almost his sole pursuit was the chase.

And so one finds that woman's hardships and burdens, her cares and trials, her sufferings and servitude, were not *all* imposed on her by the premeditated cruelty of man; but that they fell upon her rather in the natural order of things which apportioned to each sex its work and to one sex excessively dismal periods.

Necessity drew upon early man for bursts of exertion as he struggled with Nature and his own kind for food and life. These drafts were followed by equally necessary periods of rest, while woman toiled on and on toward conditions that slowly forced her into sedentary occupations,—and her work was never done.

From the time when our progenitors left the branches of trees to live on the ground, down

to the present era, the division of labor between the sexes has been unfair in kind and unjust in effect upon the development of womanhood. Arthur Mee expresses the belief that "Man has done most of the work requiring power used swiftly and violently. . . . He built the boat which enabled the human race, probably in the Old Stone Age, to spread over the whole habitable world; and he solved the problem of a constant meat and milk supply by domesticating many of the animals he once hunted. He founded religion and philosophy and law, and many of the larger arts of life." But woman, in founding the arts of peace, in domesticating wild birds and beasts, in discovering the value of roots and herbs and thus laying the foundation of pharmacy and medicine, was easily man's equal in advancing the race.

Through the ages men and women have worked side by side, each sex for the most part following different pursuits, yet tending in the long run toward, whilst never reaching, a state of economic equality. This has been their fixed, though unconscious, goal: In diversity of work, diversity of character, diversity of ideal, emotion, psychology, and of function, they achieve at last *unity* of soul. On this synthesis civilization must stand.

At certain times they have approached nearer this happy state than at others. All progress

is rhythmic. The Book of Proverbs more than hints at this state; and it is of this that the ancient poets dreamed; out of it they spun their beautiful fables of the Golden Age, when women played their parts politically as well as socially and in religion. Unfortunately, the records of civilized nations do not go back very far. The immense antiquity of the human race is only beginning to dawn upon us. The universality of symbol, tradition, and ceremony among detached peoples, some of them even without a written language, puzzle us less as we realize more how very old are many of our fairest dreams of civilization.

Periods so relatively recent as those of the first dynasty of the Egyptians and the social life of the early Cretans, are veiled. Yet we know that as much as six thousand years ago woman was given some political consideration. Two thousand years later, her honor and integrity of character were respected somewhat by the Babylonian laws. Again we observe a kind of parallelism running through the eighth and the twelfth Egyptian dynasties, and the Elizabethan and the Victorian periods of English history, when queens reigned in their own right.

At such times as woman has drawn nearer to general economic equality with man, her field broadened to enter the priesthood, not only, but

to embrace the minor divinities as well. In Babylonia, Istar was the godmother; in Egypt, Isis was the wife of Osiris; and Astarte held sway over the other goddesses of the Assyrians; whilst in ancient Arabia and in other lands, the goddesses seem to have been more powerful than the gods.

Now, coming down from goddesses to peasant women, the world finds an example in Deborah, which symbolizes a type for sagacity and endurance. It has long been known that peasant women possess characteristics, such as energy, the faculty for management, mother-wit, and others of a purely physical nature involving glandular functions and erogenous areas that are not possessed by women generally in the higher walks of life. The lover seeking romantic delights of a kind is less likely to be disappointed with Judy O'Grady than with the Colonel's Lady.

Man in time turned his attention from the making of weapons to the making of tools. His apprenticeship as an inventor of instruments of destruction served him well as an inventor and manufacturer of implements of agriculture, of art, of commerce, and of science. His art of handling weapons enabled him the better to handle tools. And although woman was the first to think of planting seeds, man first irrigated the soil. He utilized the bucket of her

invention and made it do the work of a pump; he took her hoe and made a plow of it, to which he harnessed her and later his domesticated animals; and finally he hitched up steam and electricity. He modified, improved, and glorified woman's inventions until she retired from the field to the home to devote herself more particularly to the domestic arts.

The reapportionment of labor between the sexes had a depressing effect upon the position of woman. In some parts of the world it made her a prisoner; she was subjected to moral and physical tyranny; her atmosphere was poisoned; she was both pampered and enslaved; nameless indignities were thrust upon her. A large area of her brain was forced to lie fallow. Weeds sprang up where flowers should have grown. What should have been a garden became a desert—at best, an oasis. Elemental storms swept the barren wastes. Unwholesome fruits grew upon the little fertile spot she had learned to regard as her world—her "proper sphere". Her soul was crippled. For ages she accepted her lot as natural to her sex, or as a god-given punishment for her "sin"; she asked for nothing else than what she was used to; she fiercely condemned her own kind for looking toward the east, for longing for the dawn, for attempting to arise, for calling for help, for trying to escape from prison, for

looking upward, and at last for wanting to vote, and for wishing to be consulted when they are to bear children and by whom.

Whenever vice has been most flourishing, woman has been the chief victim; yet strange to say, in most degenrate times she has, other things being equal, shown less than has man the ravages of devolution and of moral decadence. In a sense, woman may be likened to the Jew, who thrives on persecution: the more she is discriminated against, the stronger grows the solidarity of her virtues. And it may be that the epoch of her decay shall only begin when she becomes the dominant and militant sex.

WOMAN AND RELIGION

THE religious instinct is one of the finest elements in human nature. How it arose, how it became implanted, and why it has persisted in our souls need not detain us, even if we knew. There it is! We have no choice other than to make the best of it.

The longing to live again may spring from our shortened cycle of life, which is cut down by the indiscretions of ignorance. Nevertheless it is a worthy longing which, when reasonably indulged, need work no hardship on our lives, physically, morally, nor intellectually. The longing to do right in this world, to live in harmony with the great moral forces of the universe, to express our gratitude to the intellectual-ethical source, which the world believes to exist and which it calls God, for short, is not an unworthy longing. We may regard it, if we please, as a childish emotion of a young race. If it is a mere childish longing, we shall grow out of it in time; but meanwhile it will serve us well as spiritual beings thrilled with aspirations.

The hope to live again, to be able to repair the mistakes of our short lives; the hope for mercy to the maltreated, justice to the defrauded; the hope that those who have been mauled in this world may find sympathetic treatment in another; the hope to embrace again the loved and lost, to unite the threads of consciousness severed by death, to efface the memory of dead sorrow with living joy, is an estimable hope, however irrational it may seem to some.

It is no crime to believe that the fountainhead of morality is moral; that the source of intellectuality is intellectual; that the mother of emotions is emotive; that the principles of beauty are, in some inscrutable manner, born of supreme design; that the good within us comes from God. Neither is it a sin to reverse this belief: to speculate on the possibility of individual morality, flowing as tiny streams into a great reservoir, which ceaselessly becomes more and more moral. It is no sin to think that personal intellectuality contributes to the collective intellectuality of the race. It is not sinful to believe that private emotions feed a superlative public emotion; that the principles of beauty are crystallizing into a supreme design; that the good within us all is slowly creating God. It neither is sinful nor criminal to speculate, to reason, to believe, to have faith, to indulge hope, to reject, to doubt, to make a

god of reason, or a religion of ethics, or a prayer of work, or a hymn of beauty.

We may believe in one God or in many gods or in no god without helping or harming our souls—without placing in jeopardy a single chance to live again. We may believe that every human being is destined to become a god, or that when life is done each shall forever cease to be. Our religious beliefs and faiths, our postulates and hopes are negative, sociologically. The religious instinct should be cultivated until it flowers as a cosmetic garden in the front-yard of civilization. Let no man destroy its flowers, for they have been watered with tears and nourished by hope! But let all who love their neighbors help to pull the weeds, and to kill the lice that feed and fatten on the young leaves!

Religion never will harm the soul, no matter how enlightened we become. It is only when we make dogmas of our speculations; when we try to force them upon others; when we require performances that are hateful, sacrifices that are questionable, hardships that are needless, efforts that are sterile, ceremonies that are ridiculous,—then only do we pervert the religious instinct and convert it into an instrument of torture; and then it is that we enslave the soul to superstition.

We conceive of space as largely as we can,

and that conception we call "the boundless universe". There is no harm in suspecting that beyond our utmost conceptions of space and time there are other "universes" and other "times". We conceive as much as we can of power, and at the apex of that conception we put God. There can be no harm in asking ourselves whether there may not be other gods and other realms beyond our noblest conceptions of power and space. An innocent amusement is that which postulates other universes equally boundless—each with duration as endless as a circle and, like circles, intersecting without interference. We may without guilt conceive endless universes as we conceive circles, of one plane or of different planes, expanding or contracting throughout infinity. We even may postulate an infinite series of infinities, since infinity begins where our conception ends. If we are able, we may reverse our conceptions of duration and space, regarding them as points-of-view peculiar to our make of mind—as positional consciousness, as mere relativity, or as mathematical assumptions in conceptual trigonometry. Or we may cast all such efforts aside as futile metaphysics leading us nowhere, without hurt to our souls or harm to our intellects. Then, when we are all through, we come back to the religious instinct that is part of our nature; and we still are unable to affirm that it is

the unenlightened part, or a source of light itself. We must treat it therefore in a commonsense way by making the best of it. Scoffing will not help us where reason and intuition fight and fail—where revelation is silent. Our one clear duty, as intellectual beings, is to see to it that neither this instinct nor our treatment of it results detrimentally to individuals singly or collectively.

A perversion of the religious instinct clouds our lives with superstitution and it fills our minds with fear. By denying the instinct, by trying to kill it, we wound our souls as birds bruise their wings beating against the bars of a cage. There is nothing to fear but everything to hope for in religion. There is everything to fear and nothing to hope for in superstition. Superstition always has carried a knife under its cloak.

All religions are both false and true: mixtures of pious fraud and sincere devotion. No religion ever was perfectly pure; and the false elements of religion have been the enemy of woman since the first syllable of recorded fact. Superstition will remain her enemy until she laughs it out of court. She must overthrow the tyranny of dogma to gain her intellectual freedom, just as surely as she had to overcome the tyranny of prejudice in politics to gain her suffrage. She must break the bonds that bind

her soul if she would be free. And she never can be truly free so long as she is hounded by superstitious fear; so long as it is possible for priests to maintain authority over her higher nature; so long as church or state may force unwelcome babes upon her breast.

No one supposes that modern priests are especially wicked or that as a class they mean to be bad. On the contrary, the most of them are good, self-sacrificing, zealous, and misled. But I know the priesthood is an evil in so far as it has power to subjugate the mind through fear of punishment in some other world; that no form of slavery enervates the dignity and the healthy glow of character more effectually than does the spiritual bondage propagated and sustained by the Confessional. I know the priesthood is questionable to the degree of its recognized authority and potential power to practice priestcraft on character during its formative period. I believe the priesthood is mistaken when it disseminates dogma for spiritual truth; that it is dishonest when it pretends to have revelations of divine will, and in so far as it spreads fiction and faith as ascertained facts. The priesthood is stupid when it promulgates absurd doctrines; when it teaches miracles; when it builds on unsound premises; and above all, when it neglects the rational training of young minds under its sway. In a word, the

authority to do evil through stupidity or design —the power to do evil under the mantle of righteousness—that authority or that power, active or passive, is a perpetual menace to the best interests of mankind. No amount of ingenious sophistry can justify it; no argument can uphold it. It is contrary to ethics, to all nobility of soul, to clear reason and humane intuition, alike,—to the very nature of things, fundamentally; and it persists only as a flaw in every suprastructure that ever has been builded on the bedrock of decency and natural commonsense.

The religions of mankind have been many; yet running through most of them one discovers two principles: the male, or dominating; the female, or passive. Man usually has made his tutelary divinities in his own image, and naturally therefore many of them have been sorry figures. There was Bacchus or Dionysus, who was worshiped by the Greeks and celebrated in their Choral Odes. The Egyptians worshiped virtually the same god under the name of Osiris. Various other names were given to him by Arabs, Persians, Scythians, and other ancient peoples. He is diversely represented, now as a goat—which is not a bad idea when one thinks of the lubricity of the lesser gods and their sons; again his sign is the phallus, which throws all euphemism to the winds;

sometimes his sign is the bull, the horse, the cock, the pine-cone, the church-spire; he also is symbolized by fire, by evergreens, by fruits, and by the sacred grove; occasionally his spirit condescended to enter fauns and satyrs, his attendants. Great as he was, there was one greater and that was Zeus, son of Kronos, the infinite Father in Mystic theology—Father and Son in poetic Mythology.

The male principle, it is true, has not always predominated in religion, mythology, and art. But on the whole, the female principle has been duly passive notwithstanding the influence of Demeter in Greece, of Isis in Egypt, of Astarte, Venus, Hertha, and so forth in other countries. Under whatever name, she remained the goddess of the passive-reproductive principle of the earth. The fact that she once was the patroness of agriculture suggests that the first farmers were women. That she once was the tutelar deity of legislation and social order seems strange to us moderns who felt the heat of woman's heroic efforts to gain a voice in the making of laws under which she must live. Cybele, Rhea, or Magna Mater was at one time widely worshiped and justly celebrated. The Universal Mother, "the soul of everything", was beautifully commemorated in the Orphic Hymns. Thus it appears that the spiritual na-

ture of woman was idealized in one epoch, to be forgotten in others.

It is not necessary to go back to the primitive philosophy called Animism, from which religion sprang, and to follow the effects on woman of all the different cults and sects down through Polytheism and the Nomistic religions. It is enough if her status is briefly sketched under one of the Individualistic religions, since the modifications of the others are mostly epochal and environmental, whilst to all purposes they remain essentially the same.

During the infancy of Christianity, it was the women who most eagerly embraced this new hope of emancipation. So great was their zeal that many became martyrs, while thousands were missionaries and combatants. Without their far-reaching influence, the new religion could not have been established. For it was in the nature of woman that the spirituality of Christianity found rootage strong enough to carry it over Europe; and ever since, it has been in the characteristic emotional nature of woman that the Church has found its abiding strength.

The Church grew at the expense of the life that supported it; but spiritually it was loath to turn toward women. Of course the Church fathers could not rise above the source of their inspiration. The Sacred Scriptures are not especially flattering to womanhood. Little con-

sideration is shown for the beings that always have borne the major burdens of the race. Why should the Church, founded on these Scriptures, be more tenderly disposed toward women than the Scriptures themselves?

In the Old Testament woman is regarded as a chattel of man. God addressed himself only to men, unless he wished to scold. On other occasions this Nomistic or Scriptural God was solicitous of eunuchs, especially those "that were eunuchs for the kingdom of heaven's sake". We know, if we know anything, that the eunuch is not comparable to a woman in anything worth while. Yet the eunuch was exalted and the woman was debased. Moreover, why women, the best friends of Christ, should have been shabbily treated by his disciples, would remain a mystery if we had not learned to regard it as one of the false steps of religion.

The apostle, who advertised Christianity internationally, was hardly a friend of woman. St. Paul began as a Pharisee, and he ended as a thorn in her side. He believed in the patriarchal traditions of the Jews; he upheld the Mosaic laws; and he seemed to have no conception of woman's natural dignity and rights. The whole weight of his influence was against her; and in time, even his prejudices crept into the canon law of the church. This delightful old saint looked upon woman as a thing unclean and not

good for man to touch. If there ever was a saint created with the creation of an ass, paraphrasing Jeremiah, it was this same old Paul. He so loved the spirit that he hated the flesh. But his bad taste and worse manners probably were sincere, since there is no record of his marriage. He believed that the sacerdotal gentlemen who had lost their extraneous organs were best fitted to be the fathers of the church —and in this he was correct. No doubt it would have been far better for women if all sacerdotal gentlemen had been of the same order.

St. Paul divided religion, like an apple, in halves with one stroke: the two parts were psychical and spiritual, leaving nothing for any other element of our being. His doctrine crucified the flesh to the very core of lunacy. The unclean direct and indirect influences of his teaching trailed moral leprosy and bodily filth all through the Middle Ages; and it did this, unfortunately, in the guise of religion. Woman was countenanced in her natural nastiness simply because she was necessary; and she never was forgiven the sin of having caused the fall of man. Similar idiotic traits still exist in the human mind. On many occasions I have heard political henchmen storm against the candidacy of a Jew for office on the sole grounds that he was a "Christ killer".

Peter and Paul both taught that man should

be the boss in the conjugal partnership of the home. They believed that the wife, no matter how good, should be subject to the husband, no matter how bad. Paul was vehemently opposed to the higher education of woman. *Meekness, silence, subjection*—these were her jewels, her virtues! The idea of co-education, of democracy for both sexes, of equal opportunity before the law, would have shocked St. Paul profoundly.

No longer ago than the seventeenth century, according to Macaulay, the condition of women among the pious Scottish Highlanders, was appalling. An observer "would have seen, wherever he turned, that dislike of steady industry, and that disposition to throw on the weaker sex the heaviest part of manual labor, which are characteristic of savages. He would have been struck by the spectacle of athletic men basking in the sun, angling for salmon, or taking aim at grouse, while their aged mothers, their pregnant wives, their tender daughters, were reaping the scanty harvest of oats. Nor did the women repine at their hard lot. In their view it was quite fit that a man, especially if he assumed the aristocratic title of Duinhe Wassel and adorned his bonnet with the eagle's feather, should take his ease except when he was fighting, hunting, or marauding." As recently as 1915, I myself have seen equally bad

conditions in the very religious "outport" settlements of Newfoundland.

To a varying degree, this has been the general tendency of pseudo-Christianity toward woman, just as had been that of the other false contributary religious elements which preceded the new religion. Yet, despite the force of this tendency, woman has progressed; her spiritual nature has expanded; she has grown more tender; her intellectual horizon has broadened; her moral nature has developed; and with everything against her, her position, especially among the French, American, and English peoples, slowly became higher and better. Even the Church no longer holds councils to discuss the possibility of woman possessing a soul, as it did at the Council of Mâcon in 585. The Calvinistic nightmare has passed forever. Jesuitical casuistry and theological sophistry no longer are accepted seriously in society that can both read and think. Commonsense in some measure has fallen to the lot of man, who has not had the power, if he had the wish, to exclude woman from its benefits.

Such worthies as Tertullian and Jerome were bitter in their denunciation of woman—obscene in their abhorrence of her sex. Origen was so fearful of "sensual lust" that he put temptation forever away from his body by what we should call to-day rather crude operative in-

terference; and if he had thrown in the hide for good measure he would have done admirably. Augustine, Eusebius, and Jerome looked upon celibates as "heaven's dazzling stars", whilst fathers and mothers were classed with the dark orbs or "stars without light". One needs a new vocabulary, or none, to deal patiently with such notions. These pious imbeciles probably fancied that, in reversing the Hebraic injunction to be fruitful, they were obeying heaven's newer laws.

The history of religion is depressing. The vices of the clergy made victims of their confiding "spiritual daughters". In the "holy" Russia of yesterday, we saw a repetition of the fanatical horrors common to earlier Christian times all over southern and western Europe. The standard of morality under Christian and Byzantine influences was pushed backward. Religious bodies were filled with contention and lost to decency. As society became more and more debased by superstition, the women of the poor, as usual, suffered most; "the tax called *'gold of affliction'* was frequently paid, by working men, with the price of the bartered honor of their daughters". Fullom records that "a Benedictine friar, whom indolence or penury had driven to the cloister, candidly avowed that 'his vow of poverty had given him a hundred thousand crowns a year, and his vow of obedi-

ence raised him to the rank of a sovereign prince'."

At the time of Valentinian it was necessary to pass laws against the greed of priests and the rapacity of monks who preyed upon the conscience and who fattened on the property of devout women. Damascus, Bishop of Rome, and even St. Jerome, despite his horror of "sex", earned the nickname of "the ladies' ear-scratchers". After that nothing could add to their reputations.

Naturally, woman was the chief sufferer from the "lamentable depravity" and the "moral rottenness" of the early Christians. "Women took a large share in the raging controversies" amongst Trinitarians, Arians, and Nestorians, "which, like most religious disputes, terminated in persecutions; and Christians, no longer dreading a Nero or a Domitian, now openly crucified and burnt each other. The naked bodies of maidens and noble matrons were, by means of pulleys, hoisted in the air, with a weight attached to their feet; and in this ignominious posture, their tender flesh was torn with red-hot pincers, lashed with scourges, and coated with plates of burning iron. Christian contending with Christian, washed the broad streets of Rome and Constantinople with Christian blood; and in a sectarian riot at Alexandria, ferocity ran so high that the victors,

after perpetrating the most savage butchery, positively devoured the mangled bodies of the slain. What a terrible realization of that warning prophecy—'I have not come to give peace, but a sword'!

"Among the many victims of these unhappy tumults was Hypatia, a maiden not more distinguished for her beauty than for her learning and her virtues. Her father was Theon, the illustrious mathematician, who had early initiated his daughter in the mysteries of philosophy. The classic groves of Athens and the schools of Alexandria equally applauded her attainments, and listened to the pure wisdom and the music of her lips. She respectfully declined the tender attentions of lovers; but, raised to the chair of Gamaliel, suffered youth and age, without preference or favor, to sit indiscriminately at her feet. Her fame and increasing popularity ultimately excited the jealousy of St. Cyril, at that time the Bishop of Alexandria, and her friendship for his antagonist, Orestes, the prefect of the city, entailed on her devoted head the crushing weight of his enmity. In her way through the city, her chariot was surrounded by his creatures, headed by a crafty and savage fanatic named Peter the Reader; and the young and innocent woman was dragged to the ground, stripped of her garments, paraded naked through the

streets, and then torn limb from limb on the steps of the cathedral. The still warm flesh was scraped from her bones with oyster-shells, and the bleeding fragments thrown into a furnace, so that not an atom of the beautiful virgin should escape destruction."[1]

The torture, the maiming, and the murder of of Elgiva by Dunstan illustrates further, amongst thousands and thousands of similar bloody deeds, the diabolical brutality of superstition perpetrated in the name of Christianity upon women in the earlier centuries of our epoch. Indeed, religious superstition always has contrived to rob, to pester, to deceive, and to degrade women.

There is reason for this, as for everything else. Through tyranny and lack of opportunity, woman had become weakened as a social unit; her weakness was in line of the least resistance; and she fell easy prey to the basest of human passions. The paganism of Rome was almost as bad as the early Christian religion. The better nature of woman long had suffered from the nonsensical cruelties of superstition. She had been taught to search the entrails of fowls for the secrets of Fate; to question altar-flames for omens of the future. Her augurs had divided the heavens into four parts; if a flock of birds flew across one of the celestial quarters,

[1] The History of Woman (S. W. Fullom).

it was portentous of good or evil. The voice of thunder, the gleam of lightning, and the spilling of salt were threatening signs that filled her heart with dread. Juno and Vesta were favorite deities; if sins were committed against them, those sins were expiated in dungeons on "the Field of Wickedness". The Sibylline prophesies were taken seriously; and women generally were so ignorant that they believed Fate might hang on the foot put forth first in the morning; that good or bad luck lay coiled in a slipper.

Religious influence, good and bad, is only one factor in society; the influence is not always consciously corrupt; the worst superstitious elements in religion often are the sincerest; and all the elements of religion are inevitable, for they spring spontaneously from the imperfect human mind, not as divine revelations nor even as human inventions, but as natural growths; and it is fair to assume therefore that religion neither is spiritually nor morally perfect. Good and evil elements always mingle in the mind and work of man—yet *mankind has progressed.* In that fact lies the salvation of woman; in that fact is rooted her intuition which, like the cellar-plant, is heliotropic—it turns toward the light. Her soul ever was more or less vaguely conscious of the right direction, even when her eyes were blinded, her feet beset with pitfalls,

and when her false guides were luring her on to darkness.

Religion is personal as well as collective in character; therefore it is variable and indefinable. It is pure and noble, gross and indecent, kind or cruel, foolish and fantastic according to the personality of the believer. Religious formulæ and creeds and superstitious propaganda with its dogmas, orders, ceremonies and rituals, its churches and mob-clamor are, on the contrary, impersonal. To criticise these things is very different from scoffing at one's innermost faith, the factors of which not only are hard to determine by another, but are unknown to one's self. But the outward trappings of faith, the camouflage of theology, the ethical reactions in society caused by religious organizations, are public characters, as it were, and as such they are open to criticism. No one need feel a delicacy in discussing them, since it is plain that not all can be right—some must be better than others, and some must be bad.

The conduct of religious bodies is no more sacred than that of political bodies. The crimes committed in the name of religion lose none of their guilt. Armenians massacred by Turks and Kurds—Christians slaughtered by Mohammedans—is a horror as hideous in the name of religion as in the name of war. The persecution of Jews by Christians in the name

of Christ is diabolical. The atrocities inflicted on Christian Belgium by Christian Germany stains the Teuton's hand as red as the Turk's, but with this difference: The Teuton outraged his own "holy women"—despoiled and murdered his own "sisters in Christ"; while the Mohammedan hordes perpetrated their nameless infamies on those whom they believed to be the imps of Satan. Mercifully call these things the logical crimes of a state of war! Then we must admit that savagery still is more powerful than religion; and we must concede that no religion thus far has achieved the success that one might reasonably expect of a divine institution. The inadequacy of religion is the inadequacy of human nature. The hands that bind up wounds, that soothe the dying, that feed the orphan, belong to no one religion, nor essentially to any, but rather to the ethics of humanity, which is of divine tendency rather than of divine origin—its source is human; its destiny is God.

It is a demonstrable fact that woman has fared badly under our own religion. Her condition has improved not because of it but despite it shams, its shame, and its blunders. Under its authority, a violation of the marriage-vow is punished only when the culprit chances to be a woman. "Sins against purity" carry severest penance when the sinner happens

to be female. Usually the males are not inconvenienced by such venal infractions.

Celibacy imposed by the Church on healthy human beings is an incentive to sexual excesses; these excesses produce evil that naturally reacts on women. Concubinage was so common among the priests of the Middle Ages that the Bishop of Constance levied a concubine tax on his clergy. Kings who received their "divine right" to rule from the Church, and the spiritual and temporal gentry made up of knights and nobles, were notorious for their gluttony and drunkenness and for their debaucheries of defenseless women.

The Christianity of the Middle Ages or that of to-day is false, because they are not alike. Mediæval Christianity, inspired by the Biblical command, "Thou shalt not suffer a witch to live!" had a lovely time hounding innocent women to death. Thousands were hunted like wild beasts, and they were less mercifully treated when brought to bay. Pope Innocent VIII, in the latter part of the fifteenth century, was not pleased with the weather. Storms and other meterological phenomena terrified his pious soul. He therefore issued the bull, *Summis Desiderantes,* which caused more spilling of blood perhaps than any other document ever issued by a Pope, which is saying a good deal. A manual called the *Witch Hammer,* that came to

be revered both by Catholics and Protestants, was very widely used. This precious handbook taught, among other things, the subtle art of detecting and punishing witches guilty of disturbing the elements. Countless women were tortured on the rack until they "confessed"; hundreds and thousands were burned at the stake or murdered on the scaffold. During several centuries, women were tortured and slain for the theological crime of exercising Satanic influence over the weather. The Dominicans first, and later the Jesuits, were particularly hot on the trail of the witch. These sweet-souled theologians not only persecuted and murdered the witch, but they confiscated her property to meet the expense and to cover the damage done to the crops by her sorcery. As a delicious morsel of theological discrimination against women, the history of witchcraft may be ruminated by those who have a taste for such tid-bits.

Yet, what should one expect of benighted beings having so little intelligence and so much superstition that they relied on the sounding of *Ave Maria* to stop hail storms? What of those who believed that Satan's power could be paralyzed by the ringing of "consecrated bells"; that thunder is "a flaming exhalation set in motion by evil spirits, and hurled downward with a great crash and a horrible smell of sulphur"? What should one think of mentality low enough

to believe that there is revealed truth in the 104th Psalm: "Who maketh his angels spirits, his ministers a flaming fire?" Haply, Christians no longer rely on the efficacy of ringing bells to "put hellish legions to flight"—they are using high explosives and Marshals, such as Foch. Let us hope there is some beneficent progress even in superstition.

As late as the time of Newton, Father Augustine de Angeles of Rome believed that "the surest remedy", to use his own words, "against thunder is that which our Holy Mother the Church practices; namely, the ringing of bells when a thunderbolt impends; thence follows a twofold effect, physical and moral—a physical, because the sound variously disturbs and agitates the air, and by agitation disperses the hot exhalations and dispells the thunder; but the moral effect is more certain, because by the sound the faithful are stirred to pour forth their prayers, by which they win from God the turning away of the thunderbolt."

All through the darkened Middle Ages there were men who opposed, as much as they dared to oppse, the fiendish and idiotic practices of the devout. One of the splendid examples of the enlightened few of the ninth century was Angobard, Archbishop of Lyons. This good man in his work, *"Against the Absurd Opinion of the Vulgar Touching Hail and Thunder"* ridiculed

"the tyranny of foolishness". He wrote: "Things are believed by Christians of such absurdity as no one ever could aforetime induce the heathen to believe."

Paracelsus, in the sixteenth century, at his peril tried to explain thunder reasonably; he likened it to the reverberation of cannon. Professor Pomponatius of Padua also had his *"Doubts"* of the influence of devils on meteorology, but he was careful to express them only as a "philosopher"—as a "Christian" he professed a belief in all the teachings of the Church, and wisely enough thus saved his skin.

Poor Agrippa of Nettesheim was not so diplomatic. He tried hard to stem the tide of the persecution of women, and failed pathetically. Driven from place to place, he was pursued, persecuted, and reviled. The blessed Dominicans would not let him rest, even in death. They not only traduced his memory, but they erected above his grave one of the most malignant epitaphs ever devised.

The depressing influence of false religion on the nature of woman is revealed in the debaucheries of the sacerdotal Fathers. In 1259, Alexander IV tried to disrupt the shameful union between concubines and the clergy. Henry III, Bishop of Liège, was such a fatherly sort of man that he had sixty-five "natural" children. William, Bishop-elect of Paderborn, in 1410, al-

though successful in reducing such powerful enemies as the Archbishop of Cologne and the Count of Cleves by fire and sword, was powerless against the dissolute morals of his own monks, who were chiefly engaged in the corrupting of women. The successful resistance of the Swiss clergy, in 1230, against the civil authorities of Zurich, was intrenched in the sensible doctrine of the priests, as shown by their statement that they "were flesh and blood, unequal to the task of living like angels, etc."

The Council of Cologne, in 1307, tried in vain to give the nuns a chance to live virtuous lives —to protect them from priestly seduction. Conrad, Bishop of Wurzburg, in 1521, tried to reform his priests, but without success. In his mandate he accused them of habitual "gluttony, drunkenness, gambling, quarreling, and lust". Erasmus felt called upon to admonish his clergy against concubinage. The Abbot of St. Pelazo de Antealtaria "was proved by competent witnesses to have no less than seventy concubines". King Solomon's example was not entirely ignored by the good Fathers. We read: "The old and wealthy abbey of St. Albans was little more than a den of prostitutes, with whom the monks lived openly and avowedly".

The crimes and vices of the Borgias are commonplace records of history. The Diet of Nur-

emburg, in 1522, concerned itself with the evils of ecclesiastical jurisdiction, chief of which was the clerical immunity of the gentlemen who "night and day" preyed upon "the virtue of the wives and daughters of the laity".

At one time the sale of indulgences in lust to ecclesiastics was an established order, finally reduced "to the form of an annual tax, which in most dioceses was exacted of all the clergy without exception, so that when those who perchance lived chastely, demurred to the payment, they were told that the bishop must have the money, and that after it was handed over they might take their choice—whether to keep concubines or not."

John van Arkel, Bishop of Utrecht, in 1347, found it necessary to prohibit men from access to the nunneries. In Spain (1322) and in the Swiss Cantons, priests were forced by the community to select concubines in assuming charge of parishes, in order that the wives and daughters of the people should be safe from despoilation. The Council of Constance (1415), in deposing a pope, uncovered every crime imaginable including incest, adultery, defilement, etc.

Of the Pontifical Fathers of the fifteenth century, few indeed were not notorious for their "frailties". Innocent VIII was so renowned for his method of increasing the population of

Rome that he was the butt of the wits of his day; and everybody knows that Alexander VI did not allow his predecessor's good work to languish. History is bulging with innumerable similar instances too revolting for more than passing notice.

Of course, there always were honest priests and pure nuns—thousands of self-sacrificing, tender souls who were ever striving against wickedness; who bravely met, if powerless to conquer, the immeasurable difficulties of their times which, unfortunately, the superstition of their own religion but multiplied and intensified. To-day it is an exception for a priest to be wickedly designing or for a nun to be impure. The clergy generally are honest men who do a deal of good; but it is childish to suppose that they know any more about the hereafter than do those whom they presume to enlighten. It is idle to blame the wicked who could not have been good if they had tried. It is generous to praise the good who had so much incentive to be bad. And it is but honest to denounce the false religions that have been so excessively degrading to womanhood. "Custom", says Mrs. Mill, "hardens human beings to any kind of degradations, by deadening the part of their nature that would resist it."

Mean, narrow, and brutal as the Church had been in its treatment of woman, the Protestants

immediately after the Reformation became worse, if that were possible. Martin Luther was as good perhaps as he could be in the circumstances, and no doubt he was much better than the average monk; but the monkish taint shows itself in his estimate of woman in a letter to Stifel: "Catherine, my dear *rib* salutes you. She is quite well, thank God: gentle, *obedient,* and kind in all things, *far beyond my hopes.* . . ."

The spirit of puritanism was hateful and malicious. It promulgated a vindictive, a relentless warfare against persons rather than practices —against females rather than their "faults". Religious asceticism blew its frosty breath over the flowers of love, seared the fresh leaves, and chilled the plant to its roots—its puritanical fruit was hard, acrid, and gnarled.

The Puritans were as full of hatred as they were empty of humor. Their persecution of the "daughters of the devil", as they called prostitutes and the unfortunate sisters who had loved not wisely but too well, was nothing less than fiendish in its cruelty. The Puritans seem to have had no notion of the pathetic fact that a perfectly vrituous woman might be deceived, ruined, and abandoned by an unscrupulous man. The chief defect in puritanism was the lack of imagination—a defect which in the criminal mind makes the murderer.

The position of woman was seldom worse than under Puritan domination at the height of its power, which measured the depth of its negative morality. Woman was kept at the most menial of work; her natural impulses were subdued without ruth. Old Mother Nature rebelled; the result was illicit relations and illegitimate children,—both were severely stigmatized; yet both were results as inevitable as the religious intolerance that caused them.

The drudgeries imposed on married women were maddening in their monotony, wearisome and killing in their toil. As the family increased, mother and daughters became worse than slaves. Industries, later specialized and differentiated, were carried on by the housewife in the home; she was baker, weaver, tailor, barber, bleacher, spinner, brewer, soap-maker, butcher, cook, dairyist, and often gardener and fieldhand besides. In addition, as a matter of course, she bore children; she was wet-nurse, day nurse, and night nurse; she was druggist, washerwoman, and doctor. She was a victim of caste; her soul was kept in prison—her body in harness, and her hands in the meanest of filth for her men-folk and children. To her, the theatre was the "vestibule of perdition"; gossip was her newspaper; the Bible was the only form of fiction she could read without endangering her immortal soul; and the dull, gloomy church

was her only place of amusement. She was a poor benighted being—a human toad under the harrow of pious imbecility.

Puritanism not only oppressed woman and discriminated against her, but it robbed her of every spontaneous joy; it took from her the few annual fête-days which her slavery had inherited from the Saturnalia. The mirth of Carnival, sanctioned by the Catholics, was strangled by the Puritans. This same puritan spirit, although somewhat weakened, still lives in the English-speaking countries; it crops out in opposition to the great feminist movement with its lofty aims; it appears even in the little eddies of the movement itself; it is seen in our antiquated Sabbatical observances, in our opposition to divorce, in our attitude toward the Hester Prynnes and little Pearls; we can read it between the lines of Thanksgiving and other foolish proclamations of our Presidents.

The attitude of false religion toward the nature of woman always has been abominably ignorant and lamentably unjust—ignorant alike of the laws of psychology and of biology—unjust in setting up artificial standards that rigidly oppose natural laws. In sexual relations, the church looks upon the married woman as subject to the husband: she is supposed to be passionless as a statue and passive as the udder

of a milch-cow—a thing to be used and manipulated.

Peter commanded obedience of the wife to the husband; Paul insisted that the husband was "the head of the wife", that "the head of the woman is man", which probably is the reason why he thought woman was brainless.

Now in fact there is no natural, no ethical, nor any other reason why man should dominate woman in any of their social, political, or intimate relations. The nature of the normal woman is no more devoid of passion than is that of the normal man. Indeed, natural men and women are sexually complementary both in need and desire; and when unified by love, they are wholly co-ordinate and equally necessary, one to the other. This is true not only as to the noblest state of their own souls and as to the best condition of their own bodies, but also as to the wellbeing of the most fundamental instinct of the race. Whenever artificial moonshine has interfered with the orderly climax of sexual emotion, the result has been disastrous. It makes no difference whether a saint obstructs natural law or whether the same thing is effected through ignorant commands put into the mouth of a god—so far as nature is concerned, the result is the same.

The indecent sexual extravagances of mediæval times were closely related to earlier

mysticism and to the ascetism of Christianity. Commonsense, it is true, was a factor, inasmuch as it perceived the need of acceding to natural demands; but the pressure of artificial mandates of the church was too much for healthy human nature—it turned out badly. Commonsense under high pressure overflowed, it was transmuted into sensuality, and sensuality readily turned into vice, and vice into disease.

The rise of the Christian priests to domination over the private affairs of women was slow and subtle, and its end is not yet. In ecclesiastical doctrine, the sexual instinct is sinful; but as it could not be uprooted, a sacramental license was issued whereby it might at least be regulated, "analogous to a license to sell intoxicating liquors". Theology regarded sexual enjoyment as impure, but the Church assumed the authority to purify it in exchange for power and pence. Thus to the Church is owing the development of the conception of marriage as a religious sacrament.

When most of the differences between Catholicism and Protestantism shall have been shaken down and blown as dust away by the winds of time, one thing will remain to the glory of Martin Luther,—and that is his perception and acknowledgment of the needs of human love in human society. This sometime-monk, with all his belief in demons, with all his insane

moods and childish fancies and grotesque and primitive notions, nevertheless had sense enough to see the folly of celibacy among persons healthy of body and mind. Among all the many utterances of this sturdy reformer, the one that will be remembered longest for its wisdom is this: "A woman, unless she be peculiarly sanctified from above, can as little dispense with a man, as with eating, sleeping, drinking, or the fulfillment of any other physical need. Neither can a man dispense with a woman. The reason is this: it is as deeply implanted in our nature to beget children as to eat and drink. Therefore has God given the body members, veins, fluids, and everything that is necessary for these purposes. He who seeks to restrain them, and will not let Nature alone, what does he else but seek to restrain Nature from being Nature; fire from burning; water from wetting; and man from eating, drinking, or sleeping?"

It is suspected by some thinkers that the god of this litle world is still a fœtus in the throbbing womb of humanity; that our race may remain an expectant mother for millions of years; and that other millions of years may be required for the growth of this god into a full-fledged minor deity. And then the chances are even that this divinity gestating within our souls will be female. So many of the male gods

have been failures, a female deity may save the race at last from the false elements of religion. But for the present we shall get on if

"We walk according to our light,
Pursue the path
That leads to honor's stainless height,
Careless of wrath
Or curse of God or priestly spite,
Longing to know and do the right.

. . .

"We love our fellowman, our kind,
Wife, child, and friend.
To phantoms we are deaf and blind;
But we extend
The helping hand to the distressed;
By lifting others we are blessed."

—*Ingersoll.*

WOMAN AND THE LAW

Long is the way
And hard, that out of hell leads up to light.
—*Milton.*

OMAN'S subordinate position before the law is more ancient than history. Her legal status was modified by religion. Law and religion have been interwoven so long that the one can hardly be discussed without dragging in the other.

Primitive usage was the first law; and out of it the fixed tribal customs developed into what is known as personal rights. Later laws laid down by the headmen were founded on these rights. From primitive simplicity to civilized complexity, the principle of natural rights has persisted, at least in theory, in the formulation of human law.

Then confusion arose as temporal and spiritual authorities tried to co-ordinate their rules of governance. This confusion gave rise to continual conflict which imposed many hardships on society. Certain classes suffered from the inequalities of justice meted out to them, just as other classes of individuals were bene-

fited. The favored few always have triumphed over the impersonal masses. Justice, most ardently desired, has ever been most difficult to attain; and the burdens of injustice have pressed heavily on woman from time immemorial.

> "Those thousand decencies that daily flow
> From all her words and actions"

made little impression on the statutes enacted by man. Her standing in law through the ages, naturally, has not been uniform. Periods of hope and despair have followed one another. But when viewed broadly, her legal rights have advanced steadily until now they approximate those of men, and in some respects go beyond.

Beginning with the Mosaic laws—for one must start somewhere—it is evident from many known facts that these laws were built largely on precedent. The codes of Babylon were centuries old at the time of Moses and Aaron. Peoples contemporary with the Israelites lived under laws similar to theirs; while many forms of legal procedure that are commonly called Mosaic, probably are post-Mosaic. However, the fact to be kept in mind is that woman's status under the Mosaic laws is generally indicative of her standing for many centuries among some of the most enlightened peoples of the world.

We read in the twenty-fourth chapter of Deuteronomy that the right of divorce was vested in the whim of the husband: ". . . let him write her a bill of divorcement, and give it in her hand, and send her out of his house". The injustice of such early laws is everywhere apparent. In the thirtieth chapter of Numbers it is recorded that a woman could not make a vow binding her own soul without the consent of her father or her husband. Man's dominance over woman is exhibited in the record of her legal inability to inherit property if she had brothers; and even in their stead, she could inherit only if she married in the tribe, for if she "be married to any of the sons of the other tribes of the children of Israel, then shall" said heritage be taken away from her and given over to the tribe.

The position of woman in society is mirrored by her standing before the law. Her social degradation could not be illustrated better than it is in the "law of jealousies", fifth chapter of Numbers. According to this iniquitous law, which many thousands of human beings believe was given to Moses by the Lord, any old jackal, in a fit of impotent or jealous aberration, might hale his wife to court: the judge in the case being a priest and the courtroom a filthy tabernacle; there she was put to the test of the "bitter water". If the bitter

water made her ill, it was proof of her guilt: "and her belly shall swell and her thigh shall rot: and the woman shall be a curse among her people". If she escaped poisoning, she was adjudged innocent for the time being, or until her husband had another attack of the grouch. Her chances of escape however were slim since the heaven-sent formula for the bitter water reads in part: "And the priest shall take holy water in an earthen vessel; and the dust that is in the floor of the tabernacle the priest shall take, and put it into the water. . . . And he shall cause the woman to drink of the bitter water that causeth the curse, it shall enter into her, and become bitter".

The idea of testing the fidelity of a wife by forcing her to swallow the germs of cholera or of typhoid fever may have been original in its time, and the test effective; but that kind of procedure has lost is appeal. The germ-test for morals has become unpopular, and the public health has improved. As one reflects on the virulency of germs bred in the festering Orient during those unhygienic times, it is not surprising that the water, muddied with the dust from the floor of the tabernacle, was indeed "bitter".

Not only was woman subordinate before the law, she was unclean before her master. The Mosaic decree that the menstruating woman

should be regarded as unclean, had its point-of-view; but it is abominable that "she shall be put apart seven days; and whoever toucheth her shall be unclean until the even". Legally, the parturient mother of a "maid child" was twice as dirty as the mother of a "man child". For the law laid down in the twelfth chapter of Leviticus reads: "If a woman have . . . born a man child: then she shall be unclean seven days. . . . And she shall then continue in the blood of her purifying three and thirty days; she shall touch no hallowed thing, nor come into the sanctuary, until the days of her purifying be fulfilled But if she bear a maid child, then she shall be unclean two weeks . . . and she shall continue in the blood of her purifying three score and six days".

The intent of this law probably was hygienic; but its letter was cruel and degrading, and its suggestiveness was not flattering to womanhood. Such laws, especially those of sacred origin, have caused inestimable harm to society; for they not only have lent color to the primitive taboo, but they have encouraged man's brutality to woman, inevitably hurting both oppressor and oppressed.

At the time of Abraham, the position of woman virtually was that of servitude. The patriarchs had slight respect for matrimony, to which state the ties of blood were of little

hindrance. Moral degradation, ever synchronous with legal injustice, is plain in the attitude of Sarah and in the conduct of Leah and Rachel. In the household of Abraham, the "bondwoman" was sanctioned by righteous laws. Suffering the final indignity, she was made to feel the last stroke of cruelty as she was driven forth from the tent, destitute and friendless, to wander in the world or to perish with her child in the desert. Nothing can be much more revolting to our sense of justice than the legal-religious standing of women during those pastoral times. Exposed to the terrors of kidnaping, struggling under the burdens and the vices of slavery, violated and scorned, they knew no security and they had no redress.

According to Deuteronomy, when the legislative body of a semi-barbaric state sat in heaven, the bride not possessed of the "tokens of virginity" was put to death: "and the men of the city shall stone her with stones, that she die". The instrument that despoiled her of her tokens was the one chosen to be the death of her for having lost them. The robber is commanded to punish his victim. Nothing could be more ingenious.

There are countless illustrations of the subordination of woman before the law scattered through history, sacred literature, and art.

Almost everywhere, and nearly at all times, she has been forced to be unchaste and then was punished for the offense. She was restrained from marriage, and thrust into marriage against her will. Religious legislation has denied her right to a second marriage at one time, and at another it forced her into a union with the brother of her dear departed. During many centuries, religious and secular laws have been to woman, as it were, the devil and the deep sea—there was little choice between them.

The history of woman under the administration of heaven-made laws is a record of her servitude and humility: Ruth at the feet of Boaz; Jezebel "trod under foot" by Jehu; the Shunammite "handmaid" to Elisha, "the man of God"! These examples may be multiplied indefinitely. Even in Job's modest protestations of his integrity, it is suggested that a woman's deceit is worse than a man's; and he is moderately horrified at the thought lest his "heart have been deceived by a woman". But Job also had sane and tender moods; his spiritual sufferings show that he was aware of the wrongs endured by women, for he refers to his honorable conduct toward their sex. This was an exceptional prince—an extraordinary character of his day; and in nothing did his great-

ness of soul shine forth more clearly than in his better demeanor toward women.

In the Eastern countries, woman's dependence has been deplorable for ages. The inheritance of property was mostly restricted to the male line. When woman was permitted to acquire wealth, either before or after marriage, her property reverted at the death of her husband to the male members of one or the other family. For before the *suttee* was abolished by the English, it was customary for the Hindu widow to be burned alive on her husband's funeral pyre. As a great many old men had very young wives, this practice was appalling.

Woman had no standing in Hindu law; and her status was little better under the early Roman law, when her property-rights were vested in her husband. If she was unmarried, and not a vestal virgin, then her father or kinsman, or some other male person adopted by her family, held possession of her estate. Having no male relatives under the law, her wealth went to the clan or *gens*. In marriage she was sold almost as a slave. Not qualified to hold office, she was legally an imbecile. As she had no standing in court, she was unable to enter into a legal contract; nor could she appear as a witness. The few privileges granted to her were given in the spirit of pity.

Among the meagre crumbs that the law cast

at her feet, was the right to accuse witches. This was only a theatrical step toward civilization. The right of one woman to hale another to court as a witch is quite on an ethical level of granting two cats the right to have their tails tied together and be suspended from a clothes-line. Woman was legislated against on almost every occasion. If she mourned too much for her dead, a repressive law forthwith was enacted. She could make her will only under the supervision of some male. In ancient times, her father or husband sitting in family council had the legal right to put her to death without a public trial. Roman law regarded her character as "unsteady", and it was referred to as "the weakness of the sex".

During the second century B.C., some changes favoring women began to appear in the statutes; and from the time of Augustus to that of Justinian, more or less steady progress was made. Woman became independent or *sui juris,* first, if she were the mother of three children—an extra child being required of the freed-woman; second, if she were a vestal virgin; but as there were only a half-dozen of these, the opportunity was narrow; third, by a special act, of infrequent occurrence, which granted her independence with restrictions. The restrictions usually nullified the grant; and at best her legal independence was more in

name than in fact; even her power over her children was exercised through an *agnate*, or guardian.

Despite all the harshness of early law however, woman was greatly respected in her own home during the best period of Roman civilization. Her influence in the family gradually extended to the political sphere, where it reached its culmination during the first three centuries of this era. And although the political power of such women as Agrippina and Livia, unusually strong characters, may not be regarded as typical, nevertheless it indicates what was possible to the sex in the circumstances.

In the early period of the Republic, women were severely punished for wine drinking; and according to Valerius Maximus, wives who tippled "the sweet poison of misused wine" were now and then beaten to death by their husbands. But at the same time, gluttony, drunkenness, and adultery among the men were glozed over. There was however a distinction made between the status of women before the law and their standing in society.

The high regard of Marcus Aurelius for the teachings of his mother, and the affection of men like Pliny and Quintilian for their wives, were far from being sporadic examples of Roman sentiment. Some of the best historians

believe that the majority of the better conditioned Romans was duly appreciative of the nobility of character then, as before and since, widely borne by women. Gradually the hard and repressive statutes were softened and relaxed until in actual effect they lapsed into dead-letter laws.

In ancient Roman times, marriage was possible in three ways: first, by a mock sale of the woman; second, by solemn rites considered sacred, which permitted the issue to qualify for the priesthood; third, by a common-law method that made the marriage legal after the couple had lived together for a year under certain prescriptive rules. These three forms of marriage persisted until about the second century, A. D.

Marriage by proxy was allowed later, and usually it was arranged by the woman's parents or guardian. Slowly the authority of father over daughter became weakened until the daughter's consent was essential to the marriage contract. Sons however could not be forced into marriage against their will, although the father's consent was necessary to the validity of the daughter's marriage.

In time, Roman marriage developed into a civil contract founded on consent and defined by law as "the union of a man and a woman, and a partnership of all life; a mutual sharing

of laws human and divine". The real status of the wife however was that of a daughter, since the husband held her in *manu*. The widow was compelled by law to wear for ten months the external signs of mourning, and to refrain in public from certain social diversions for the same period. The widower, on the contrary, was free to mourn or not, externally and internally. These laws were in force until they were remitted by Gordian, the youngest, in 238, A. D.

From absolute power over his wife, the husband's authority diminished during the first three centuries of our era until his domination was in name rather than in fact. The wife's control of her private property was one of woman's victories achieved under the Roman law. This is referred to in some of the Comedies of both Terence and Plautus. The state wisely conserved its own welfare by guarding and keeping inviolate the doweries of women. Gradually also the penalties of adultery grew lighter, until husbands became rather complacent.

During the Empire, as society grew lax in morals, the grounds for divorce became more and more trivial, although the initiative rested too long with the husband. Cicèro could divorce Terentia for a richer and younger woman. But in time, woman also acquired rights to initiative in divorce which became easier and

more frequent, especially in the better circles of society. *Univira* became so rare that the designation was engraved on her tomb. Theselina, according to Martial, married ten times in thirty days, and thus established a record that hardly has been equalled by the most enterprising stage-folk of to-day. The only form of marriage legally indissoluble was that of *confarreatio*, because the priests of Jupiter were recruited from its issue.

Roman law in its flower permitted women to engage in business pursuits such as the retail trade, the keeping of hostelries, barbering, the running of vaudeville, the practice of medicine, and so forward. The powers of the guardian had diminished; and woman's standing in the law courts had become well recognized. In fact, women were so successful as pleaders that, according to Juvenal, it was difficult for men lawyers to stand against them; and finally the pendulum swung toward a partiality for women litigants. With the rapid advance of women's rights before the law, arose their many facilities for acquiring an education, which were later abolished under Christian rule. Yet with all the benefits received by women from the Roman law, there was no definite provision made for the public education of girls as for that of boys.

At the time of Justinian, women could be-

queath and make legal contracts. Indeed, several of the Christian emperors were kindly disposed toward a greater freedom for the sex. Slight improvements were made on the pagan laws so that, for instance, mothers no longer were dependent on their sons for the simplest acts of justice. In many ways, Justinian showed his taste for civilization; above all else by his imperial championship of woman's cause and by his charitable disposition toward her "frailties". He softened the Constantine penalty of death for adultery to imprisonment in a convent. It is questionable which punishment was preferable at that time; but the emperor's intentions were good. He was a trifle severe with the Jews; but that has been condoned by Christians on the grounds of his religious fervor. If, for example, a Christian woman married a Jew, both were held to be adulterous—but the Jew never was purposely confined in a convent for punishment.

Many good laws were promulgated by this worthy emperor for the benefit of working-women and others; but the old notion of woman's "natural inferiority" lurked in the minds of the most Christian of rulers. The canon law upheld the husband's supremacy and power over the wife, and it introduced several novelties to the Roman law: A priestly benediction was necessary to make the marriage ceremony

valid; women were not allowed to "desecrate" the church by holding any public office under it; nor were they permitted to come within certain fixed limits of the altar; and having "professed religion, they could not be forced to give testimony as witnesses". Of course this was no favor to their sex, since it tempted them to compound with crime.

In the northern regions of Europe, early laws differed according to locality, and some were much more liberal toward woman than they became later. Sometimes inheritance was through individuals; again, it was through classes, when there chanced to be no male heirs. The Scandinavian women were under a rigid guardianship; even as late as the latter part of the seventeenth century, a woman could not marry without the consent of her male "tutor"; if she did, her tutor was empowered to administer her estate for life, and to pay himself a salary for his services.

In England, before the Conquest, a woman was punished for adultery by having her nose and ears cut off; female slaves were burned alive for petty thefts; penalties for witchcraft were brutally severe, whilst only a mild penance was exacted for the beating of a slave-girl to death. In the time of Ethelbert, wives were bought and stolen; but it was provided by law that if a freeman stole the wife of an-

other, the thief must procure at his own expense a new wife for the injured husband.

Under the old common and statute laws, woman's position differed materially from man's, and she was not permitted to forget her inferior station. She could not testify in court in certain cases, either for or against a man. She was allowed neither to appoint a testamentary guardian nor to act as one with full powers over her own children. Magna Charta treated her niggardly. She was legally burned for witchcraft and treason—and that no longer ago than in the latter part of the eighteenth century. Women also were the victims of sumptuary measures in matters of style and dress and the materials of dress, as well. In a word, they were treated in general as children before the law.

Woman gained much from marriage in later primitive times, and she lost much by marriage under the law in still later times. For all her gains, she was compelled to bear endless burdens as concomitant results. From the dawn of history to feudal times, and down to the present day for that matter, marriage has thrust upon her many onerous evils.

Under the common law of England, marriage despoils woman of her legal existence which however the law is gracious enough to grant on special occasions when it is deemed

desirable to punish her for some misdemeanor. According to Blackstone: "By marriage the husband and wife are one person in the law; that is, the very being or legal existence of the woman is suspended during marriage, or at least is incorporated or consolidated into that of the husband, under whose wing, protection and *cover*, she performs everything; and is therefore called in our law-French a *femme covert*".

Agreeable to this form of "crystallized justice", the wife loses her body, her civil reputation, and her legal existence,—and for what? If it may be admitted that she still has a soul, it is of too little importance to be considered by the law. From this legal *oneness* of *two* beings, arise many unjust discriminations against the wife. Ordinarily, in criminal practice she can not bear testmony either for or against her husband. Fortunately, there are cases in which the husband is made to feel the disadvantages of having absorbed his wife's personality. "For slanderous words spoken by the wife, libel published by her alone, trespass, assault and battery, etc.; he is liable to be sued, whether the act was committed with or without his sanction or knowledge."

The injustice of the common law is plain when it assumes the absurdity that husband and wife for punitive purposes are one and the same

person. From this dictum have arisen many social evils, among others the destruction of popular reverence for the law. Under the operations of this law, the rights of the married woman are so few and elmentary that they are almost negligible. For her, there is no "uninterrupted enjoyment of" *her* "limbs", *her* "body", or of *her* "reputation". "If a wife be injured in her person", Blackstone says, "or her property, she can bring no action for redress without her husband's concurrence, and in his name as well as her own."

Annie Besant, one of the wisest and noblest of women, says in her work on "Marriage": "If in a railway accident a married woman has her leg broken, she can not sue the railway company for damages; she is not a damaged *person;* in the eye of the law, she is a piece of damaged *property*, and the compensation is to be made to her owner. If she is attacked and beaten, she can not summon her assailant; her master suffers loss and inconvenience by the assault on his housekeeper, and his action is necessary to obtain redress. If she is libeled, she can not protect her good name, for she is incapable by herself of maintaining an action."

A ghastly treatise might be written on the legal debasement of woman under the English common law. In the presence of justice, the

wife has no standing because she has no legal existence. At the court of her husband's "rights", her status is that of a servant or a piece of property. If the husband is granted a divorce for unfaithfulness, he can put in a claim against the corespondent for monetary damages sustained through the loss of her services. The same rule of law applies if a minor girl has been seduced. Regarded as the property of her father, she has no redress of her own, but he may recover damages.

As late as 1856, Lord Lyndhurst in the House of Lords, said: "A wife is separated from her husband by a decree of the ecclesiastical Court, the reason for the decree being the husband's misconduct—his cruelty, it may be, or his adultery. From that moment the wife is almost in a state of outlawry. She may not enter into a contract, or if she do so; she has no means of enforcing it. The law, so far from protecting, oppresses her. She is homeless, helpless, hopeless, and almost wholly destitute of civil rights. She is liable to all manner of injustice, whether by plot or by violence. She may be wronged in all possible ways, and her character may be mercilessly defamed; yet she has no redress. She is at the mercy of her enemies. Is that fair? Is that honest? Can it be vindicated upon any principle of justice, of mercy, or of common humanity?"

This law deprives the married woman of her sacred rights, if any rights in this world are sacred; and it robs her of self-respect. It kills the nobler virtues of the home, and it turns the warm heart of love into the cold stone of legal privilege. The wife is stripped of authority over her own body; sick or well, or revolted at the bestiality of her husband, she has no protection from his connubial violence or brutal passion. Through marriage, the law denies her the protection it gives to harlots and concubines. The husband can not be guilty of rape if the act is committed on his wife; he can not be guilty of murder, of homicide, nor even of misdemeanor, if his uncouth passion destroys an unborn infant or perhaps the life of its mother, as well.

Another vicious element in the old common law is the provision made for the husband to administer corporal punishment to his wife. If anything may be expected to conserve a wife's personal dignity, it is an occasional beating at the hands of one who should love and protect her. Think how inspiring the conjugal life must be that is punctuated with a cudgeling! This provision of the law suggests the old couplet:

> A dog, a woman, and a walnut-tree,
> The more you beat 'em the better they be.

In fact, wife-beating has been practiced so long that many women look upon it as a right more personal to themselves than to their husbands. In some benighted parts of Russia, the wife who is not occasionally "brushed down" by her husband feels neglected, and suspects that she is losing ground in his affections. A parallel state of mind exists, or did exist, among the women known as anti-suffragists in enlightened parts of America; they were so used to the indignity of a subordinate civic position that they regarded it as normal to their sex, and therefore a right—reprobating the "manishness" of their sisters' discontent under political bondage.

We read in Blackstone: "The husband also [by the old law] might give his wife moderate correction. For as he is to answer for her misbehavior, the law thought it reasonable to entrust with him this power of restraining her, by domestic chastisement, in the same moderation that a man is allowed to correct his apprentices or children. The lower rank of people, who were always fond of the old common law, still claim and exact their ancient privilege." The great commentator construes this as a wise provision of law for the protection of women—something for their general good; and he adds without intentional humor, "So great

a favorite is the female sex of the laws of England"!

No longer than forty or fifty years ago, it was common for some men under their "ancient privilege" to drag their wives out of bed by the hair of their heads, to tear off their night-robes, to torture them, to knock them about, to dance on their bruised bodies, to beat them with sticks of prescribed thickness, and, in a word, *moderately* to "correct" them.

Linked with man's legal right to correct his spouse was his authority to deprive her of personal liberty. The husband was delegated automatically by law with judicial and constraintive power over his wife. He was not only the judge who sentenced her without due process, but he was her jailer as well. She was in all essentials his property.

The English law subjects the married woman to many concrete hardships. It strips her of the natural rights that are hers while unmarried, even though a mother. For example: if single, she owns her body and her child, if she has one; she has the liberty of action that her married sister forfeits; she can own property and defend herself against attack; she possesses a measure of independence and personal liberty for which she is accountable only to the law. Against these advantages she suffers social stigma only if she is a mother or a woman

of joy; and in addition, her children, being illegitimate, are restricted in their rights and made to feel an odium that ought not to exist in any decent society.

Of course the common law has been greatly modified by all sorts of legislative acts; but its spirit is not dead. Indeed it is lively enough to show the state of abasement into which woman has been kept for centuries by the laws of one of the most enlightened nations of modern times.

Some of the anomalies of the more modern English law are interesting. A woman may be queen or regent; she may exercise the highest political rights; yet, until recently, women could not vote at a parliamentary election nor be elected to parliament. Their political rights, such as they have, are more or less modified by marriage and prejudiced by their sex. A short time ago, woman was ineligible to most of the learned professions and limited in admission to university degrees. This is amazing in an era of intellectual activity, especially when one observes that ignorant moneybags and windy politicians are freely given degrees when some of the most intellectual of our race are denied them solely on account of sex. Women may take examinations at Oxford and Cambridge, it is true, but not a degree, unless the rule has been lately changed.

A married woman having property is "liable for the support of her husband, children, and grandchildren chargeable to any union or parish". The husband has the first right, other things being equal, to the legitimate offspring; he could divorce his wife for adultery, but not long ago for the same offense she could not divorce him unless she could show cruelty, or desertion besides, or some other abomination on his part. But her advancement in property rights grows steadily more hopeful.

All through the English law may be discovered vestiges of the time when women were chattels and very little else in the eye of the law. Yet it was the English law that arose above the laws of all other nations by being the first to take from adultery the sting of crime. Sin it might be, but crime it should not be. The English law-makers had gumption enough to imply at least that husbands who can not retain the fidelity of their wives and wives who lose the fidelity of their husbands do not deserve it, generally speaking. The English law with all its faults was at least sane and virile enough to be philosophic in this particular. Wife-beating and witch-baiting and slave-whipping have passed out. In Scotland, some remnants of the early sumptuary laws still persist; but there as elsewhere the lagging spirit of the law is quickening with new life.

The idea of a husband regarding himself as injured because he can not retain the love and the loyalty of his wife, is ridiculous; but when he is horny enough to put in a legal claim for damages, he sinks beneath contempt. It seems far more reasonable for the wife to plead damages for her partner's conjugal failures.

The law's unwisdom also is mainfest in its refusal to grant a divorce where collusion can be proved. It is absurd to any save a legal mind for a court to honor the plea of one party, but to reject the plea of both parties co-operating in the same purpose

Godfrey, in his "Science of Sex", says: "The enforced continuance of an unsuccessful union is perhaps the most immoral thing that a civilized society ever countenanced, far less encouraged. The morality of a union is dependent upon mutual desire, and a union dictated by any other cause is outside the moral pale, however custom may sanction it, or religion and law condone it".

The indecencies, inconsistencies, and difficulties of the divorce court emanate from the traditions of the canon law doctrine of the indissolubility of marriage, the sinfulness of extramatrimonial embraces, the primitive property idea of marriage, and the ecclesiastical degradation and legal subordination of woman.

Thus a breach of marriage came to be regarded as a public injury.

The law has opposed the best development of woman's moral feelings. "Morality", says Havelock Ellis, "may be outraged with impunity provided that law and religion have been invoked". For this state of affairs we must thank ecclesiastical insolence and the inquisitorial tyranny of the law—the blind parents of anarchy. In the words of William von Humboldt: "Experience frequently convinces us that just where law has imposed no fetters, morality most surely binds; the idea of external coercion is one entirely foreign to an institution which, like marriage, reposes only on inclination and an inward sense of duty". The amatory life of man and woman can not be regulated by statute, circumscribed by code, nor is it subject to the canon law traditions; it must travel its own road and go to hell through ignorance or soar to heaven through wisdom. Legal molds, crudely cast for the masses, inevitably pinch thousands of the best individual assets of society.

In the present state of mankind, the sexual demand for variation is a fact for law-makers and judges to consider; it can not be ignored where justice is desired; and it is best taken care of by allowing individuals, under enlightenment, to work out their own salvation in their

own unobtrusive ways. The less prying—the fewer the statutory acts—the better. The essential monogamic element will continue, and it will continue to take care of itself; but if it is to perish, no legislation can save it.

Men have made rules and passed laws for one-sided connubial felicity long enough. They have considered their own requirements, within variable degrees; whilst the inferior position of women affords them only the lopsided happiness of adapting themselves to their husbands' pleasure, regardless of their own physical and spiritual needs. No one should begrudge women a chance at last to take a hand in the making of laws under which they must live. The sexual need of variation is as much a part of woman's nature as it is of man's; and any save the most general repressive rules are useless or harmful. The vital fires of love can not be controlled by rote and rule. They are subject only to the unknown god that presides over the inner being of our nature.

We shall never succeed in legislating civilization on ourselves. Statutes and codes, like precepts and creeds, are mere makeshifts, wornout almost before they are fit to use. Our law courts never will have any jurisdiction over the human soul. The less we have of all this that we can get along without, the better. The sense of freedom in love, the thrill of joy in

passion, and the other ecstasies of mood in the rhythm of life were not born of codes and they never will work well in stautory yokes and religious harness. The only effective statute law is one that has genuine public approval—one that carries the conviction of justice to the average mind; and the only religious precepts that can help us are those that enlighten the emotions while appealing to the mind.

Alfred Russel Wallace truthfully said: "Compared with our astounding progress in physical science and its practical application, our system of government, of administrative justice, of national education, and our entire social and moral organzation, remain in a state of barbarism". This is especially true of our legislative system. Thousands of useless laws are made at a cost as amazing as the laws themselves are burdensome. Our statutes have been millstones on the neck of progress. Our printed constitutions seldom have borne any vital relation to government. The unthinking class accepts precedent for reason, custom in the place of commonsense, and the lash instead of justice; and when it does make a protest, it either whines or growls. The truth is, we are pharisaical barbarians.

One should not cry justice and speak unjustly. The judiciary deserves serious consideration, and usually it gets respectful attention.

But the general opinion of the laity is that the judges are more likely to "hand down" their decisions according to influence than according to justice; that the rich get what they want oftener than the poor what they deserve. This of course is not always true. There are many judges who are both honest and intelligent. The miscarriages of justice result from the ignorance of the law-makers oftener perhaps than from any fault of the judiciary. It is notoriously true, just the same, that the so-called legal education is no education at all. The very things that the legal gentry and the legislators should know the most about, they fail in. To be learned in the technical precedents of practice—to be familiar with the musty laws of other days—is of no progressive importance. The science upon which judicial functions should rest is extremely modern. The prated "philosophy of the law" is a myth, or, better a moth-eaten weft woven of darkness and error and figured with passion and predjudice and stained with blood and wet with "tears such as angels weep".

The fundamental necessities of legal education are, if approximate justice is the aim, a knowledge of the animal organism and its relations to environment, as well as a knowledge of the human mind and that of its comparative history. The functions of the brain can not be

understood if the animal organism is not understood; for it is in the animal organism that the mind has its roots—roots that run back through æons of organic development.

Punitive laws are founded on vengeance and on the phantom notion of a "free moral agency", which we know never has existed on this flying island called the world. Modern science has proved that to deal justly with the functions of the *will*, the basic functions of the organism must be studied from their dawn down through the morning of life; the architecture of superorganic structure must be known; and the by-products of emotive function should be utilized without waste and needless pain. In dealing with the question of human justice, it is apparent that the little round ovum is as much a thing of life as is the infant that has passed through the dramatic change of environment called birth.

At present, legal education takes little note of these important things, and with psychology it concerns itself almost not at all. It follows that, as our lawmakers are guided by the legal mind when not dominated by lobbyists and superstitious poltroonery, the evils of the statute books must be attributed to ignorance. For, to understand the intricacies of the working social organism, and to deal with them intelligently, it is necessary to understand human na-

ture, to know something of comparative anthropology, and all the little that has been learned of psychology.

This takes us back along the trail of earlier types, through comparative zoölogy, and into the very cell-life of things. Certainly, no one should be expected to know anything worth while of the social structure and its functions who knows nothing of the individuals whose initiative and reactions determine social phenomena; nor can much pertinent data be gathered from a study of individuals by one who knows nothing of the cell-world wherein each individual is, as it were, an embodied universe. The lack of this knowledge is the well-spring of judicial blunder and legal perversion, both having weighed so heavily on women for ages. Thus it is that many of the misfortunes of woman before the law and many phases of her miserable state, now happily passing, are owing to ignorance and the faulty sentiment thereof more perhaps than to premeditated tyranny on the part of man, as a law-maker.

OVERMAN AND UNDERMAN

WOMAN has been the nether millstone for ages. If she becomes the upper, it may be with a vengeance; but she will not grind us finer in her new rôle than man has in his old. But if woman should rise to a dominant position, let us hope it will be with understanding and not in the mere imitation of man's failures and errors. If the political activities of women are to echo those of men, there will be confusion in our halls. If women fancy that human nature is going to to be changed by their ballots, they are mistaken. If they use their hard-won civic rights, not as trophies of victory nor yet as a means of political reprisals, but as agencies to be employed sensibly for the common weal, the van of progress will move forward.

The great inspiration of the feminist movement is the worthy desire to live a full life—the yearning to reach the heights of being, and thus to attain a better command of the art of living. Human beings, surely, are justified in responding to this inspiration. The soul that will not struggle for its rights is unworthy to possess them. The soul that relinquishes its

rights is guilty of self-mutilation. No one should fear to explore new realms where wider possibilities abound; but everyone should hold fast to all the good that has been wrenched from bitter experience along the old roads.

Humanity has never feared to suffer, and it never should be afraid to laugh: for suffering and happiness is our lot. Suffering is the season of spiritual regeneration; and happiness is the time to spend spiritual wealth. These are the two seasons of the soul—the climate of human consciousness. We can no more escape our spiritual conditions than we can avoid our physical environment; but both can be made better. This elemental fact justifies all our efforts to enlarge our opportunities to make life richer and fuller.

Our ideal should be to become entirely human. When that stage has been reached, there will be time enough to dream of the *superman.* Now the term has no meaning—no more than the words *angel* and *saint.* When we shall be able to say, Lo, we are *human* at last! there no longer will be *overman* and *underman* connoted by sex. There still will be relative differences between men and women but not of position, since in all the essentials of living there will be equality of opportunity; and in the striving for the ideals of life, there will be the fullest co-operation between the sexes.

It is possible that humankind yet may develop a third sex. Human society may be forced to parallel that of the bees by forming a third sex and diverting it to the end that millions of human beings may be content to be what millions now are compelled to be, willy-nilly: that is to say, the loveless workers of the race. As social beings, we are too young to determine the trend of social organization; but we can guess that it will eventually so limit the rights and so circumscribe the liberties of the workers that their very thoughts shall become social instincts forgetful of *self*, and striving only for the good of all; and that the joy of living will beat in the great heart of the hive humming among the stars.

This may come to pass, and it may not. Present conditions are not favorable to prophecy. But as we interpret our longings for justice, it would seem that society has no right, and that it should have no power, to suppress the normal functions, to limit the spiritual aspirations of individuals; that society has no right to circumscribe the natural acts, nor to destroy the elemental instincts of the individual so long as these natural acts and instincts do no harm to the social organism. Yet that is what society is doing to-day, and what it has been doing since the records runneth not to the contrary.

Slavery has existed so long, in so many forms,

that the most soulful of our kind are spiritually hardened; those who could not be calloused died of pity long before the war. Spiritual gladness can not exist in a world that holds even one slave. Life is meaningless in thraldom. Superstitious bondage, it is true, may produce a mania in the victims in which exaggerated ecstasy forms a kind of compensation for the slavery endured; but the compensation is not real, but merely the *ignis fatuus* of civilization that leads us astray.

The economic slavery of this period is not as devitalizing as it was, but it is bad enough. The wage-slaves used to find forgetfulness in drink; now they find an unrest in prohibition that leads to rabies. Having shed some of the rags of slavery, they are eager to put on the robes of tyranny. This is precisely according to human nature, because human nature is far more stupid than wise. No matter what class rules, the ignorance that is in us is responsible for the needless misery sure to follow. It is the same in all classes: the priests, the politicians, the capitalists, and the so-called proletariat. The bane of our kind is ignorance. Ignorance begets misery, and misery begets crime. The propaganda of religious superstition thrives under economic slavery. Wage-tyranny wipes out religious superstition and writes down economic superstition in human

blood. The beast within us does not change when it changes its hide. Whether the success of feminism will kill the beast, remains to be seen. One thing is tolerably certain: the freedom of woman can not make him worse than he has been through all recorded time.

It is not work that kills. The workers who kill time butcher themselves. Capitalism and caste and class are old offenders. Valid happiness rests on a foundation of honest work and fair play. The man who has found his work and the woman who has found hers have achieved their destiny. Napoleon said: "A man is immortal till his work is done". Back of his words looms a grander idea: *Man is immortal only through his work;* and that perhaps is all the immortality he deserves.

We are told in glittering homilies that woman's work is in her home; and common experience tells us that countless thousands of women have no homes. What are these women to do, and how many of them find their work? The most of them are misfits; most of them are buffeted about by a fate as aimless as it is cruel; many of them are tied up to hostile tasks; and finally, the most of them are cast out, as the good God's old shoes, into the back alleys of civilization. In our pre-war order, these women toiled and suffered for what? To wear a few rags and to eat a few crusts—to

glut the capitalist with luxuries and to dress his fancy women in silks and jewels. The present order is slightly different, but far from ideal. What is to be done? Enlightened men and women with equal civic rights must eventually answer the question.

The noblest inspiration is that which directs us to our work; yet in our social order too few of us ever find it. Nothing is more dignified than honest labor; but how many human beings labor in the light of spiritual dignity? Why is it that idle fashion scorns those who work with their hands? The fault is not altogether with idle fashion, bad as it is. Why do humble craftsmen, and earnest peasant women working in the fields look so fine in art? Is it because art lets us see them on pedestals built by useful work? Is it because art clothes them with spiritual grandeur? If all were truly civilized, they would look just as fine as the beaver or the bee.

As we have seen, woman's work for ages has been slavery. Arrogance and ignorance have been her masters. The lash has fallen on her heart as she was driven forth to overtax her strength while her mind was darkened. These mothers have given sons; and only from such mothers could come the tyrants; only from such mothers could come our pettifoggers and priests —the parasites of the poor and the apologists

for the rich! Only from such mothers could come sons and daughters capable of objecting to better conditions.

The specialization of work, brought about by the differences of sex, forced woman to learn many useful things beyond the primitive capability of man. Olive Schreiner suggests that necessity, operating through woman, first taught man to walk on his hind legs. Gradually, the invention of machinery and the redistribution of labor temporarily confused society by introducing new forms of slavery which forced women to degenerate, many of them from slaves into parasites—two classes ever in opposition to the best interests of society.

Pericles saw life from the summit of civilization. We who dream of lordlier heights would do well to recall what that wise old Greek said to the Athenian women: "Aspire only to those virtues that are peculiar to your sex, and think it your greatest praise not to be talked of one way or another". Perhaps our epoch is not agreeable to such counsel, for we know that these words fall on deaf ears to-day. Many of our women unfortunately imitate masculine politics, on the theory maybe of fighting the devil with fire; whatever the reason, they have caught the itch of notoriety and noise from the men, until nearly all our women leaders lust grossly for the public press.

The time, so long coming, for women to shed the meanest of their shackles seems to be upon us. A world-cataclysm, shaking civilization to its foundation, has crystallized the feminist movement into somewhat definite form. For the first time in history, the position of women has risen during war. The rule has been for their position to fall through warfare and to rise with the civilization founded on the arts of peace. It is too early to say what the final effect of the world's greatest war will be on the status of womanhood. We can be sure only of this: women have demonstrated their fitness to co-operate with men in the arts of war as they had previously in the arts of peace. The stress of Serbia opened wide the door to woman's usefulness in war. Her success in the Levant assured her an opportunity in western Europe. Her work in the hospital, in the field, in the factory, on the platform, in business, and at home, is too well known to be more than mentioned. On the other hand, militarism, usually the enemy of woman and a bar to her advancement, may have done her morals a grievous hurt—more harm than many generations can heal.

Whatever the future may hold, this is sure: The present tendency of society is toward economic equality between the sexes. Cradle-songs no more will lull women to sleep. The woman

who must earn her own living—who must work out her destiny unaided by a mate—will cease to rely on tradition and prayer; but she will seize on every facility that society has to offer. Only a wretched creature would think of throwing an obstacle in her way.

Men and women are beginning to see the unwisdom of strife between the sexes, of competition instead of co-operation, of independence rather than co-ordination of effort. They are beginning to realize that neither sex can reach the highest plane of material wellbeing and of spiritual unfolding without the other; that, sociologically, the help that is meet for woman is man; even, as in their intimate relations, the help-meet of man is woman. The element of independence, which makes for cleavage between the sexes, is a factor of degeneracy, no matter whether it is found in the "new woman's movement", which is very old, or in the old man's inertia, which is not very young.

The Anglo-Saxon women, so called, aroused all the peoples of the earth by a movement that seems destined to liberate the women of East and West, of North and South. The age of Pericles will be eclipsed, we hope, by a greater age when women shall be free. The senile civilizations shall take on youthful vigor while holding fast to mature wisdom. If this shall

come to pass it will be through world-wide co-operation of earnest men and women.

Idle polemics on the superiority of one sex has gone out of fashion. It no longer is a question of capability, but of relative differences of function between the sexes—functions which must be co-ordinated if we would achieve the greatest good for both. It makes no difference whether the average brain of man is heavier than that of woman; but if it did matter, Professor L. Manouvrier's deductions would be pertinent; for he has shown "that the active organic mass of woman's body is to that of man's as, at most, seventy to one hundred", whilst her "brain-weight is to man's as ninety to one hundred". This "superiority of comparative brain-mass, however, implies no intellectual superiority", he adds, "but is merely a characteristic of short people and children". The fact of relativity between the sexes is the sole basis of a philosophy that has any pragmatic bearing on the development of the race.

The obvious differences between men and women are structural, physiologic, and psychic; sociologically, their differences are of opportunity and training; intellectually, the possibilities are equally common to both. It may be said broadly that man is stronger of body—woman is stronger of constitution; that man is a better fighting animal—woman is a better

domesticator; that man is better fitted to guard the home than is woman who created it; that man has become a better inventor of the arts and implements of war, just as woman has come to surpass him in the domestic arts. Thus the sexes differ in characteristics which, however, overlap and interweave. On these coordinated differences the strength of the race stands.

It is suggested that the human being is, among other things, a detached form of consciousness conditioned by what we call environment—a form which epitomizes the universe—a form of consciousness that has become intensified as a focus intensifies light by making the rays conical—a form that is sentient and in a way, automatic. This idea is supported in many ways, among others by the facility with which the soul adapts itself as its needs alter. We find a new psychologic force, so to speak, springing up wherever there is a new need. Conditions change and men and women are supposed to change with them. How much they really do change is a question. Through the darkness of ignorance the sexes stumbled and fell into the bogs of competition and blind strife. Has human nature been changed by the fall? No one can say. I fancy that woman still is as a healing salve to man's hurts—a rest and a joy to his nerves—the restorer of his

spent power, and the courage of his soul; but, say some, competition has made her his nettle-rash, the thorn in his flesh, the gall in his wine. But the true man still is a pillar of strength to the true woman—still her protector and provider—still her faithful, if somewhat frisky, comrade on life's trackless sands. I do not like to think of him as her assailant in ambush, who sets traps and digs pitfalls for her feet. I do not like to think of her as his vampire—as the worm that turns—as the antagonist of man. Nevertheless, as man and woman strive more and more for economic independence of one another, rather than for economic co-operation, they will find less and less spiritual need of one sex for the other; and consequently their sexual life will fall to lower levels. Human sexuality is an accurate barometer of spirituality. As each finds less spiritual need of the other, they will the more easily fall into opposition harmful to both; and thus they will tend to close in a vicious circle what should be the open helix of progress.

It seems too self-evident to be stated again that there should be no conflict between the sexes, as *sexes*. True, the wage competition between men and women is asexual; but that competition should not exist. Equal pay for equal work is only commonsense practically ap-

plied. Decency demands it, and the wellbeing of society can not exist without it.

The successful person in well ordered society is not the one who has wrung riches and power from others—not the one who has become conspicuous for a day or for a century—not the most learned, nor the greatest philanthropist; but that person who, in passing through the threatening days of this short life, renders the most good to others, and who inflicts and suffers the fewest wounds and the fewest defeats of soul. That person is successful to whom every day is a Sabbath day that brings a gleam of joy to the sentient world.

Competition for bread between men and women, or between adults and children, is monstrous. Strife may strengthen the race, but conflict between the sexes must weaken it, because nothing could be more contrary to reason and to every known principle of the higher order of things.

Woman is essentially the home-keeper. It is natural that she should be the soul presiding at the hearth. Nothing could be better for the individual — nothing better for society. But misfortune has driven her forth and thrust her into unsympathetic labor. She has been pushed into competition with man. Society has committed this sin against her and so long as the competition is tolerated, society has no right

to withhold from her any of the privileges of the game.

The great law of sex is *divergence of function, unity of purpose.* This beneficent law is violated every time woman assumes man's functions, or man woman's. But the onus of this violation should not fall on the unwilling victim. Man's régime dragged woman into the lists of capital and labor at war, or united in unscrupulous efforts to rob. While such conditions last, it is the clear duty of society on the whole to maintain fair play between the sexes.

The sexes should not war against one another, but together against the causes of disorder—against our blind system of economics—against our ignorant schemes of education—against the vices of capitalism, the manias of extreme radicalism, the superstitions of religion, the evils of our marriage system; against the haphazards of parenthood, the crimes against childhood and age—against the cruelties of creed, greed, and custom—against the prejudices of caste, wealth, and power. Not until the sexes strike hand and touch heart in a world-over movement seeking light where there is darkness, shall justice even so much as try to reign on earth.

Men have tried to nationalize education. Women should try to nationalize health—health of body and hygiene of soul. It is better for

the State to have its citizens well-born than highly educated and measly. No degree of learning can atone for miserable inheritance. No nation can become great that can not produce healthy children; but many nations have been great without state educational systems. The best primary school is the home; the best teacher is the wholesome influence of home. Colleges and universities are failures if not built on the foundation of the home-influences. The spirit of the home is woman. The society that drives her from her home into the market-place commits sin; and the society that forces her into unfit motherhood commits suicide.

Man has written his own nature into the very constitution of society; he has made its law in his own image. The nature of woman has been forced to adapt itself to circumstances. Very likely, if woman had made the laws they would have been little better. The truth is that neither sex alone is competent to regulate the ethical and the intellectual relations of society, although either sex may, after a fashion, take care of the joint material resources. The awakening of women to a realization that action on their part is necessary to social best being is one of the promising sociological phenomena of our times.

Woman can reach her highest plane of development only by the cultivation and a conserva-

tion of her feminine characteristics and powers, not by the assumption of the masculine. The differences in character of men and women constitute the lure of the sexes, one for the other, from which springs the inspiration of the race. The secret of civilization lies not in the obliterating of these differences, but in the accentuating and in the harmonizing of them. For the principles of human nature can no more be changed by our own conscious efforts than a man can lift himself by pulling his shoestrings. The collective soul of mankind can grow only through a co-operation of the sexes, in which man helps to make woman more womanly and woman helps to make man more manly, and in which both help to make coming generations healthier and free from the mistakes that have embarrassed their own generation.

A commonsensibly arranged co-operation between men and women should bring about equal rights under the law, equal opportunities, equal privileges, equal freedom of choice in marriage and divorce, equal moral and civic duties in all affairs that equally concern both sexes.

Such self-evident truths should need no champion in any enlightened age. It has been urged however that as men and women have different groups of feelings, their mental attitude is not the same, and therefore that they are not subject to the same rules of governance. The an-

swer to this is that woman stands at the gates of life—man at the frontiers; one represents the metaphysical or idealistic side of the race—the other, the physical and practical side. Co-operative harmony is all the more essential to the welfare of the present generation, and it is quite indispensable to the future happiness of the child coiled in the loins of to-day.

THE FEMINIST MOVEMENT

WOMAN was the first slave; she may be the last master. Nature intended her for neither. Conditions, new to ancient humanity, were responsible for her earlier bondage. The mind in its childhood, and sentiment in its infancy may be forgiven much. It is possible also that conditions in the future, for which humanity may not be prepared, shall make hers the master-sex. Give the race time enough however and neither sex will dominate the other. Give human beings time enough and there will be no sentient slaves left on earth. Men and women will be masters not of each other but of themselves, of law, order, and energy. Justice will be their god. The traditions of human cruelty will be on a level with our folk-lore, or the tales of Atlantis. Mercy, no longer needed, will have fallen into poetic memory. Beauty and Strength will be the pillars of society; and Love will be the only religion.

Let us have confidence enough in humanity to predict its future attainments! Let us have reverence enough for its wise potentiality to

forecast its coming glory! Let us have a fixed faith in its destiny; and let us feel a fanatic happiness, if you please, in that faith! But let us not close our eyes to the fact that the trail of the past is short compared with the road that humanity must travel in the future.

Progress is very slow when measured by our nervous vision. Shift for a moment the viewpoint by so much as a concept, and all our changes appear to have come overnight; we are bewildered by the rush of things. One reason for this is that the mind of man is not prepared for the tragedies and comedies of life; if it were prepared, there would be neither tragedy nor comedy; and without its smiles and tears the soul would be poor indeed. Whether we view progress as slow or swift, we must know that it will be long.

The wise fatalist assumes that what has happened, was inevitable; that what is to happen, he may have a hand in. Nothing is gained by mourning over the past; but a great deal may be gained by considering the future. This makes it possible for mankind to think out its destiny. A little thought goes farther than much prayer. The feminist movement is humanity thinking in terms of social progress; and this thought is expressing itself through the vitality of womanhood.

Primitive man fought the great cave-bear and

the saber-tooth tiger—and was victorious. His generations have overcome many more formidable obstacles. The victory of man over beast was owing to the advantages of flexible thought over rigid instinct. The mastery of man over his environment is the power of thought over nature. The feminist movement is the struggle of thought with the inertia of society—the sluggish, unreasoning instinct of mass-mind. In this struggle thought must win.

By accident or design, in some period of prehistoric darkness, the hand came in contact with a strange object which it grasped awkwardly at first. The object was a key which the mind has learned to use and, by its use, to unlock the door of relativity that conditions all life. Through the door of relationship we discovered the laws of activity, called progress.

The key is represented by invention which at first was crudely mechanical. The development of invention enabled man to gain increasing control of the external world—to transform it to his use and material benefit. The use of the key is represented by the automatic psychic power that came to be the soul of the social body. This soul contains, among other principles, a moral force that guides human nature—a force that aspires, as it were, to the ultimate control of our being. With this soul the feminist movement is concerned.

Primitive men singly fought wild beasts and slew them. Later men united to overcome the harsh conditions in which they found themselves. Modern men socially organized are transcending one after another of the laws of ether and energy which hamper them. That is to say, continually we are bending natural principles to our will. We have in fact learned how to make use of adverse phenomena as the sailor of contrary winds. So we shall learn to overcome the social inertia hostile to civilization; and the feminist movement, as one of the factors of progress, will help to do it—it *has* to help, for the die is cast. In time we shall rid ourselves of kings, capitalism, militarism, and syndicalism. We shall find a means of making the soil of earth as free as the air of heaven; and the feminist movement is a step, we trust, in that direction.

The children of primitive parents inherited the powers of brutes together with a few higher characteristics. Modern children inherit from all mankind—more from organized society than from their direct progenitors. The children of to-day inherit the conquests of yesterday a little more readily than yesterday's defeats. That is the hope of the generations. A selective law, working through the mentality of mankind, seems to winnow the chaff from the wheat of time. Thus the people of this epoch

are able to profit by the social consciousness of epochs past; and the social consciousness of to-day will be modified, expanded and passed on to the children of to-morrow. The aim of the feminists should be to make this communistic soul a little more tender, a trifle more just, and slightly more comprehensive of personal nature.

Social consciousness sweeps onward like a river fed by many streams. This does not mean a corresponding increase of individual intellectuality. The intellectual growth of individuals generally, lags behind the growth of the intellectuality of society. The general level of personal intellectual capacity in any civilized nation to-day is not as high by a point or two as it was at the best period of Greek civilization, over two thousand years ago. Our modern gains in comfort and material advancement are owing to the organization of a remarkable quasi-personality, or common mind of society. No better example of this phenomenon is needed than the mental, the moral, and the material coordination shown in the conduct of the world's greatest war.

Our heritage from society may be likened to a ready-to-wear garment into which the personality of the child is molded by the vague deity that presides over our spiritual nature and material environment, both more or less

in orderly relationship. That is to say, the child inherits adaptability; it is born with a mind capable of learning—a mind extremely sensitive to social suggestion, to reflex thinking: thinking in terms of aggregation; in a word, with a brain capable of inductive cerebration, which is a kind of mental reverberation. Also the child is born with potential initiative. As the initiative becomes active, it affects its mental environment by action and reaction between individual minds. Similar ideas and like purposes unite to produce an intenser initiative that is at once impersonal and social in its nature. If it were not for this fact, society once crystallized would remain changeless; classes used to bondage would remain in slavery forever; classes inured to degradation would accept their lot as the "will of God"; and there would be no feminist nor any other humanist movement. The men and women who lifted hand or voice to make society better would be outlaws in perpetuity as they now are during life, or until society has had time to see its error. As it is, all rational radicals, all reasonable reformers, all real lovers of their kind who translate their love into deeds are, during their lives, usually regarded by society as criminals.

The sad truth of this social phenomenon has many examples: Christ not only was execrated

by his contemporaries, but he was shamefully murdered; Lincoln was hated and traduced almost to the hour of his assassination; Thomas Paine still is in disgrace; John Brown went to the gallows as a criminal lunatic; Robert G. Ingersoll was despised by all good Christians during his life—slandered and misunderstood by the pious since his death; Eugene V. Debs perhaps will die in prison—calumniated and traduced by the very men and women whom he loves and serves; Margaret Sanger's righteous work is viciously condemned by the whole Catholic church; Dr. William J. Robinson, American pioneer in the movement to control human birth for the benefit of all mankind—a great philosopher—one of the superb characters of our epoch—probably is doomed to petty persecution all his days by pernicious numbskulls; and perhaps he will be misunderstood always—certainly by vast hordes of pious imbeciles. Wendell Phillips, William Lloyd Garrison, Susan B. Anthony, Mary Wollstonecraft, Annie Besant, Anna Howard Shaw, and thousands of others who have labored and sacrificed themselves to make the heart a little more tender, the mind a little broader, and to bring justice a little nearer, were unpopular during the greater part of their lives. Contemporary popularity is almost a badge of shame, and usually it is the mark of mediocrity.

Although the child is molded to fit the clothes prepared by society, some kindly law working through variation and diversity, encourages personal enterprise and quickens individual invention. Fortunately, the individual may contribute a leavening that raises the level of the mass-mind. As all persons do not inherit alike, all can not render equally. The masses live by prescriptive rule, and think in terms of imitation; but they have a communistic spirit that is easily touched by imagination or romance; thus the mass-mind may be aroused by individuals to imitate what is good, exceptional and rare, or wild and foolish. All propaganda is based on this fact, even the most pernicious. For it seems to be in the individual mind that the selective factors are so arranged that they have the power of co-ordinating experience both into wisdom and wickedness. The individual assembles scattered racial ideas into personal concepts. He invents, and society profits by his invention. An idea turns into machinery and wealth, into art and science, into mercy and the love of justice.

Social consciousness is the synthesis of dissimilar mental habits, dissimilar fetishes, similar ideals, common desires, habitual reactions, prevailing longings, similar sensations, established orders, etc. All these and many other factors synthetically unite in the engine of ac-

tivity that makes for progress not only but that produces the awful cataclysms periodically shaking civilization and threatening society itself. Germany has taught us what this engine can do when it is morally idiotic but scientifically efficient. Russia bids us to beware. Capitalism, both friend and enemy of man, has ravished the soul of civilization whilst building its glittering dome. Bolshevism has drowned its noblest ideals in a sea of blood. Superstition has done a like hideous thing in the name of religion whilst erecting splendid temples to God. One need not reflect long to see that social consciousness easily splits up into class-consciousness readily capable of running amuck; that unless the mass-mind is dominated by soul and lighted by reason, its dynamic engine is as likely to drive backward as forward; and that it has indeed very often in history destroyed much of the good work that man has painfully done; for its blind caprices have impeded progress for centuries, and more than once dragged us back into barbarism.

It follows that the introduction of feminism into the management of affairs would be of little advantage to civilization if woman's head and heart brought nothing new and vivifying into our social consciousness. The hopeful fact however that woman is unlike man, yet his equal in all moral and intellectual possibilities,

justifies the experiment. The field long fallow gathers strength. Fresh psychic energy should be capable of stimulating sociologic growth of the right kind. The political rights of women, wisely exercised, should be of inestimable service in the government. The creative ingenuity of women should help us to build worthy social structures. The sensitiveness of womanhood to moral principles should be a soul to the judiciary in its deliberations, and a conscience to our laws in their making.

Society long has cogitated, besides its material interests, such subjects as immortality, religion, ethics, art, philosophy, etc.; but the question of simple justice to woman and child has had, relatively, little serious attention. The feminist awakening, as it is called, so widely active in so many different ways, is a phenomenon of social conscience at work, whereby humanity may be induced to think in nascent terms of progress.

Primitive communities accepted the subordinate position of woman as natural, and therefore proper to her sex. There were many reasons for this, some of which have been mentioned. In a general way, sociologic influences of an inevitable nature, rather than rank depravity of the male *homo,* determined her status. Her sex has made her dependent on man at recurrent times; she was subject to suc-

ceeding periods of emotional and mental inertia; she was ruled by superstition, and she was bound down by crude conventions; she ever was more slave than man to imitation that, from time to time, arose to the dignity of custom and became a fashion; fashions founded on savage routine increased their sway over her as the elements of docility throve in her mind.

As women were enslaved by the psychology of society working through their sex, so must they be liberated by the same means. The high tide of barbarism with its synchronous low ebb of ethical invention has passed we hope forever. When the social organism is of a low order, its rigidity is high; then it is that vicious suggestion runs rampant and progress becomes stationary or turns backward. The feminist movement really has more intimate and vital relations with the psychology of society than with forms of government and material welfare.

The most important problem for feminism to consider, is that of sound citizenship. It is a poor country that exchanges health of body and soul for commercial wealth. That country is richest that has the most sound citizens, at once able-bodied and spiritually developed. We can not expect robust children from sickly and over-worked parents. We can not hope for healthier children in the next generation unless we improve the conditions of this. We must

not leave future generations wholly to chance, to ignorant whim, to brutal passion. The obligations we owe to the past make us debtor to the future. We can not discharge our debts to the dead, but our spiritual wealth and physical vigor we can pass on to those who are about to live.

If men are blind, women at least should see that the obligations of society to the pregnant woman are definite and clear—as definite and clear as the duties of the expectant mother are to her unborn child—duties that were sanely valued by the Chinese many centuries ago. It is over a thousand years since Madam Cheng wrote: "Even before birth his education may begin; and, therefore, the prospective mother of old, when lying down, lay straight; when sitting down, sat upright; and when standing, stood erect. She would not taste strange flavors, nor have anything to do with spiritism; if her food were not cut straight, she would not eat of it, and if her mat were not straight, she would not sit upon it. She would not look upon any objectionable sight, nor handle any impure thing. . . . Therefore, her sons were upright and eminent for their talents and virtues; such was the result of antenatal training".

It is commonly known that hundreds of thousands of expectant mothers, so called, are surrounded by the saddest of conditions, and that

they are forced to live the most unhygienic of lives. What is society doing for these women? Very little compared with what should be done. The philanthropist contents himself with giving a little of his ill-gotten gains for the posthumous perpetuation of his worthless name. The charitable organizations pay their officers fat salaries to insult the self-respect of helpless mothers—and society continues the dance. Once we become civilized, charity will be regarded as an impertinent and childish infamy. When all human beings shall possess their rights, they will have no need of charity.

It is the destiny of womanhood to solve many important problems, among which is that of marriage—for marriage embraces more than things sexual. Woman never will shed her many shackles until she has achieved economic independence, unrestricted activity, and birth control. When she has won this freedom, she will rise to the dignity of a thinking being strong enough to safeguard her own conscience concerning her freedom of choice in love and in motherhood.

WOMAN SUFFRAGE

IT is too late to argue for or against the franchise alike for men and women—for suffrage is the badge of all our tribe. The right of women to have a voice in government, no longer need be discussed since the exercise of that right virtually is in their control. The fight was long and bitter. It developed many interesting phases and not a few picturesque personages. It seems strange now that the fight was necessary.

The backbone of woman suffrage is the dignity of womanhood. Woman's spiritual nature is a sacrament that could not be profaned forever, nor could it be obscured by any degree of infernal cleverness. The whole issue of woman's enfranchisement centers in her personal dignity as a human being, both intelligent and responsible. Every other consideration or contention is subservient to this imperious fact.

No sensible person believed that the equal franchise, in itself, would solve our sorry economic scheme. Yet no one doubted that it would help to make some conditions better, since nothing could very well make them worse. Every-

body knows that our democracy has its defects; and no one can be cock-sure that our system of suffrage is the best possible basis of government. Nevertheless, the ballot is the best instrument of its kind that has been devised, and one as well suited to woman's use as to man's.

The educational benefits and the governing powers of suffrage are about equal. What may be said for and against the one, may be said for and against the other with equal reason. Until the civic conscience of men becomes alert through education, the voting power of women should be helpful to society, because women may be expected to react as quickly to civic as they do to other needs. Yet the suffrage question, economically considered, is a minor one in the feminist movement; but so far as decency or the dignity of womanhood is concerned, it is a major question that could not be ignored.

The question of superiority of either sex did not enter the core of the problem at all—hardly even the question of equality. The broad issue rather embraced the supplemental union of the natural differences between the sexes for the highest good of both. During the long fight many irrelevant contentions were raised by the champions on either side. One of these contentions was that of the emotionalism, commonly ascribed to women. Of course, if society had to be governed by either emotionalism or

rationalism, the choice would fall to reason. It so happened however that this issue was a man of straw. Besides, it has been demonstrated that the ruling powers of society perform best their functions when reason is tempered with emotion. Indeed the emotive and the rational phases of the woman's suffrage movement could not be considered separately any more than love and hope can be separated in our thought. There always will be both men and women more sensitive to the emotional than to the economic stress, just as there always will be others of both sexes engrossed with the economic problems of society. It was futile therefore to argue whether woman was disqualified for full citizenship by her emotional temperament, since she is possessed of reason as surely as man has emotion.

Another objection raised against woman suffrage, was woman's primary obligation to motherhood. That objection to her civicism really was an argument for it. Woman's secondary obligation to follow the occupations of producer in the industrial, the scientific, and the æsthetic fields, also worked in favor of her enfranchisement. Since motherhood makes the male necessary, and since females have been driven to industrialism for livelihood, a political union of men and women has become almost as necessary to society as the sexual union al-

ways has been to the race. The results of sexual union automatically take care of themselves. Women fit for motherhood, having opportunities for marriage, will supply the generations. Women unfit for motherhood, or having no opportunities to marry, will not idly languish, but they will engage in pursuits useful to themselve and needful to society. Therefore, both the married and the unmarried women had a right to the ballot that could not be denied them with decency.

As human beings, women are going to make the fool mistakes that are common to mankind; and they will use the ballot as human beings use and misuse everything they handle. In that respect we do not expect them to differ from the men; but as human fallibility has not been a sufficient reason for men to deny themselves the ballot, it was not deemed a valid reason for withholding votes from women.

If it were feasible to disfranchise the ignorant and the vicious, it would be desirable to do so; and if it were practicable to admit only wise and good women to the polls, it would be well; but as we have no such selective means at hand for the women more than for the men voters, we shall have to rely on the slowly awakening civic conscience, on the spread of education in political economy, and on the develop-

ment of intellectual efficiency among women, as among men, to make them fit electors.

Man's opposition to woman's possession of civic and political rights, was mean enough; but the attitude of the women *antis*, was meaner. The women who asked for enfranchisement did not propose to force other women to vote who did not wish to do so—although it might be only political wisdom to penalize the refusal of any reputable citizen to cast a ballot.

Suffrage has not interfered with woman's interest in the home; it has done no harm to the instincts of motherhood, and is not likely to do any. Voting has not lessened the sexual attraction of woman. Civicism will interfere with her womanly qualities no more than will an athletic training or a scientific schooling. The kind of woman that a normal man likes best, is one most fully developed of body and soul; the woman he likes least, is the *manly* woman, and the creature most despised by both sexes, is the ladylike man.

With the advent of woman suffrage, approaches by another step the era when woman shall be free from the curse of drunkenness thrust upon her and her children by man—when womanhood and manhood shall share equally in the conquests of humanity—when marriage shall rise above the level of a commercial transaction, or a mere sensual license—when relig-

ion shall not uphold the husband's sexual gratification at the expense of the wife's self-respect —when, in short, the subserviency of women shall not be considered as the will of the Lord— when "the man of God" and the man of the world will be regarded equally as enemies of civilization whenever they shall attempt to frame iniquity into laws that oppress women, or to apologize for such laws already in existence.

The cruelty of man's political dominance over woman was well shown in classic Roman times. Women were so humiliated in that vaunted era that many sought escape by suicide. What relief was offered by the Roman Senate? A law was passed to the effect that suicides should have their naked bodies exposed in the street. It did not occur to the Senators that it might be better to legislate some abatement of the harsh conditions that made death by suicide preferable to living degradation; but the Senators thought to punish the final desperate expression of wretchedness by attacking the virtue of modesty. This legislative enactment did not seek "to make life more attractive, but death more repulsive". Would this have happened in Rome, we ask ourselves, if women had possessed the right to vote?

During the heat of battle for woman suffrage, many odd issues were raised by the opposition.

One of the most stupid was, that centuries of oppression had unfitted women for the exercise of this political right. Fortunately for us all, the effects of use and non-use of political rights are not transmitted to offspring; but if they were, the effects of disuse would not be inherited by one sex alone, since women bear sons as well as daughters. Happily also, daughters no more than sons inherit the effects of their mothers' deprivations. Individuals transmit acquired character, capacity, capability. For example, no linguist, however proficient, can transmit his linguistic accomplishments to his offspring. His child, like that of the unlettered peasant, must begin by learning the alphabet or its equivalent. The child can inherit only such characteristics as those which enabled the parent to become, for instance, a great linguist or a great musician.

Those who fought the movement for the emancipation of woman from economic and political bondage, were slow to understand the plea that encircled the earth; they persisted in shouting inanities such as the Almighty's "designs", revealed by woman's "deeply implanted instincts", etc.; they did not understand that woman's instincts were implanted by the hard conditions of her lot; and they were blind to the absurdity of making distinctions without differences; they never questioned

their own knowledge of the divine will, nor did they wonder how it happened that they had been favored above others with this knowledge.

Another silly objection to equal suffrage, was the implication that woman wished to be man because she asked for equal consideration under the law, equal opportunity to live as a self-respecting citizen of the state, equal chance to be useful and happy. Her desire to vote was no sign that she wished to be a butcher, or even a soldier. If killing must continue, there are sausages to be made at home whilst men do the sticking afield. The women who wish to vote are not clamoring to wallow in the political mudholes made slimy by men. The women who can not trust themselves in politics need not enter that field merely because they have the right to do so; but they are extremely rude and unreasonable when they try to keep other women out who wish to enter.

Every right is coupled with a duty. The right to live and be happy is yoked to the duty to let others live and be happy. The only "divine right" of kings, as Carlyle says, "is the divine right to live as kingly men". The rights of women are the duties of men; and "votes for women" is a draft by the future, the first instalments of which we are now beginning to pay.

The conscience of society begins to feel that

if woman may own property or possess any other civic right or any political privilege, there is no reason why she should not possess all civic rights and all political privileges equally with man; that if laws are made for the decent treatment of expectant mothers, it is reasonable that the mothers themselves should have some voice in the making of those laws. Society is beginning to see that if workingmen should have political rights, so should prospective mothers have them, for they do the most important of the world's work. These women not only work with their hands, but with every fibre of their pulsating hearts, with every drop of their blood, with every organ, and with every breath. Surely society is justified in allowing these workingwomen an equal right with workingmen to vote for legislative amelioration of their lot. Those who are engaged in the vital industry of the race should not be subordinate politically to those who work for the material interests of society, or to fill the coffers of our lords of finance.

There are many opportunities for women with ballots to show their fitness to advance civilization. There is the old red mark of Cain on our statute books. The votes of women can wipe that out. Capital punishment and civilization can not exist in the same community. Nothing can be more demoralizing to society,

more hideous in its blight on the growing morals of children than the cold-blooded murders committed by the state, and graphically exploited by the public press. Voting women can remove this stain as easily as they have obliterated the corner saloon; and they can help to enact other measures to satisfy justice.

There is something we may yet learn from the queen-bee of the rights of motherhood, of the uselessness of the blind and selfish fatherhood that deprives children of the support rightfully theirs. There are two lessons to be learned: the ancient lesson of life that the bees can teach us; and the more recent lesson of soulfulness that we must teach ourselves. Motherhood may be expected to teach this lesson, and to enforce it by helping to crystallize it in our laws. From one view-point, motherhood is the largest interrogation-point that confronts the mind's eye. The potentiality of motherhood through suffrage—one of the many avenues of outlet—no longer could be ignored by the body politic.

We do not want the influence of woman suffrage to encourage mountebanks to multiply our dogmas. We have creeds enough and enough religious precepts; and already we have wasted enough time in useless prayer to feed the whole world by productive labor. What we need is practical sense enough to be guided by

equitable principles. Caste, aristocracy, class! We always have had more than enough of these. We crave something now that will broaden life, something that will enhance our happiness, and ennoble our being. We want to civilize both the rich and the poor. We should like to see the candles of spiritual enlightenment burning on the altars of the church—the cobwebs brushed off our statute books—the lights of liberty for man, woman, and child burning in every home.

Few of us are enthusiastic enough to believe that woman suffrage can do all these hallowed things; yet there is no doubt it can help in a thousand ways. For example, it can help to modify the marriage laws by injecting them with sensible eugenic principles. That can be done without establishing human stud-farms, or neglecting the psychology of love and our moral nature. If we wish science to improve heredity, to temper environment, to provide nurture, and to supervise the hygiene of body and soul, then science must have the support of our laws. If clean sentiment is to keep its seat in the soul, then men and women together should express this sentiment by means of the ballot whenever possible. For it should be borne in mind that the ballot is the voice of preference, a symbol of thought, the expression of a wish; moreover, as an instrument of desire, it is essentially feminine rather than masculine.

The ballot is an implement lately devised to be used in the art of living. It is a very simple little device which, if handled wisely, leads to large results. This implement, guided by the sensitive intuitive skill of womanhood, should be effective. The supreme art of living aims to enhance the good, to ennoble the commonplace, and to intensify the personal spirit to an impersonal or altruistic degree. Back of terror, this art models a grotesque grin on the face of perception; it clothes comedy with tragic garb; and it strips tragedy of its farcical embellishments. As we are only beginning to acquire some of its technic, it is well that we shall have thenceforward the help of women.

In the long run, the soul infallibly will take care of itself—only its appurtenances ever are in danger; but in the taking care of itself, the soul is apt to wander, and liable to incur prodigious expense. Art is the means of forestalling this expense. When we apply the art of living, we discover that its technic involves the whole field of human activity: humble toil, daily mistakes, clear thought, high feeling, science, mechanics, ethics, politics, philosophy, economics, religion, and the rest. Each of these in its own way is a worker-bee that contributes to the architecture and the life of the hive, which is the world, whose queen is the human soul brooding her dreams of the future. One sex standing

alone is almost as impotent as a detached social unit. Individuals must keep in harmony with the trend of the race or perish. The sexes must keep in harmony or the race will perish. There is no room in the scheme of things for anarchy. The race-rhythm is elemental and inexorable; and to this rhythm art attunes itself.

Enlightened universal co-operation between the racial units is out of the question for ages to come. The wholesome endeavors of some must be cancelled by the harmful activities of others. Good and evil oppose one another in the balances; slowly through the epochs must the scales rise and dip. Aside from religious precepts, and despite philosophic doubt, the good, it is hoped, gradually augments, and if so, it must predominate eventually over evil. The statistical method of observation indicates that *good* is a constructive element, so to speak, in the psychology of life. If it were otherwise —if *good* were relative merely, and the tendency of psychology, evil and destructive—the race would have perished long ago.

We may be sure that the racial trend is toward well-being. In primordial epochs the trend was subconscious and slow. Only since mankind developed society, and society developed consciousness, and consciousness developed conscience, has progress become accelerated. The means of intensifying the conscious-

ness of society to the effects of good and evil, therefore, become more and more important; for by these means the soul is nurtured. Thus correctives and checks are valuable social tonics, and as useful in their way as the various ethical stimuli are in their way. The ballot is an effective inhibition, the use of which is especially suitable to women.

It is a significant fact that during all the rumpus raised over woman suffrage, no one formulated a valid argument against it. Society seemed dimly to recognize that women not only had a right to vote, but that the exercise of that right was necessary to a complete womanhood. And why? Because, second only to the dignity of woman's personality, is her imperative duty to co-operate with man in every way possible for the betterment of human beings, present and to come; because, if she is not man's full partner in all human rights and privileges, she lacks by so much the power of co-operation spiritually and therefore materially; because, if woman is not fit to vote, she is not fit to be wife and mother. The fewer rights possessed, the more one is hampered. The civilized person must use for the benefit of society, not only every means at hand but other means must be invented as new needs arise. The spiritually minded must use the eyes of the soul even more than the eyes of the body; for the

world that the civilized person sees does not exist to the savage. No valid argument was raised against woman suffrage, because no one can argue against co-operation and good health by preaching anarchy and extolling the blessings of disease.

The Crusades gave to Europe the advantages of foreign travel; the result was new ideas and a broader horizon. Following the long period of fanaticism, came a reaction that slowly improved the condition of woman in society. Art was first to respond: minstrelsy began to sing; the trouvère, in the *langue d'oïl,* sang for the sake of the story; the troubadour, in the *langue d'oc,* for the sake of lilting music; for the spirit of Provence, inherent in her beautiful language, was born to express above all else wonder and romance. The Chansons d'Amour, de Geste, and the influence of the Minnesänger, all aided however indirectly, the bettering of woman's condition. Love and generous deeds were celebrated until chivalry blossomed into flower, even although the flower was unlovely compared with others that we know.

Then came the printing press, woman's best friend, her liberator and savior. Through the work of this marvelous engine she shall achieve full possession of all her rights, albeit the time is far-off. For the publishers themselves will have to be emancipated from the per-

nicious influence of capital dedicated to special interests rather than the general good. We all know very well that our publishing houses for the most part, like our institutions of higher education, are so rankly commercial that they are slaves to the powers supplying them with capital when the pickings are lean.

The mind of woman is becoming free, and her soul is nearing emancipation. She is thinking and expressing her thoughts—as usual. She is growing tired of silly tales, and she no longer is afraid of the bears that frighten little children. The religious bugaboo will cease in time to strike terror to her heart. She now demands what naturally belongs to her, and she sensibly rejects what was unnaturally thrust upon her. She still admires muscle in man, but she likes to see it associated with mind. She still is attracted by military garb—still debauched by militarism as by some other isms; but she will grow out of her weaknesses sooner or later. She is beginning to prefer opportunity to flattery, justice to charity. She no longer is satisfied with the crusts and crumbs of knowledge, nor with the petty slaveries entailed by our marriage system. She would rather stand alone than lean on a broken reed. She is brave enough to bear the burdens of this world, and she will be courageous enough to meet the fortunes of the next, if there be one, without

the services of the clergy. Eventually she will rid herself of all the divers breeds of priestly parasites,—cleansing her mind of sacerdotal filth. Then she will refuse politely but firmly to make popes of books or men; for she shall be free to think and to speak, to love and to be loved, to bear a babe within marriage or without by the man of her choice as conscientiously as she now votes.

I can understand the reason why woman suffrage was not a sizzling issue to some of the well-conditioned childless wives, to some millionaires' old-maid daughters, to some "rich ladies" in pursuit of sensations, nor even to some well-to-do mothers happily occupied with the home. Many such women get along very well without the ballot. In their several ways they know the usual happiness and sorrow that must come to all. Suffrage could not add to their happiness nor take from their sorrow. If the bounds of womanhood reached no farther, equal suffrage would not matter.

As it happens however there is another class of women here in the West as widely separated from their more fortunate sisters as night from day. They are the fruitful wives of the city's poor. These women feel most the evils of the corrupt ballot and the need of sympathetic suffrage. For it is these wives and mothers who bear the heaviest burdens of our economic life;

they must fight the hardest battles with the least hope and the poorest ammunition. Ceaselessly they must fight to live; continually they are confronted by their relentless enemies: poverty, disease, and corruption in every form. Those who are lucky enough to have the wages of a husband for help, yet have greater difficulties to overcome than he who found the job and earned the unleavened dough. Every expenditure must be calculated to a nicety, if the family is to hold together even in fair weather, to say nothing of the storms when sickness and death and no work are the unwelcome guests. There are millions of these women fighting in every degree of misery, in every form of deprivation, in the most unsanitary environment and hygienic neglect. Have these women a right to vote, or should that privilege be conserved for the politician under the control of the landlords, the sweatshop bosses, the food profiteers, and the scallywags of wealth, power, and position?

No one but a savage would imagine that these women have the interests of their children less at heart than their more fortunate sisters, or that the ethical principle is less vital because it throbs in their harrowed souls. Such women as these need the ballot, and their need is their right. Society does them scant justice in permitting them to try to better their sad lot by the

ballot. I believe in these women. I believe they should have a chance to make life easier and better for themselves, and richer for their children. That reason alone should justify woman suffrage. "For the dew of its birth is the womb of the morning."

THE ETHICS OF MARRIAGE, ETC.

MARRIAGE naturally polygamous under the tribal conditions of one time, becomes as naturally polyandrous in other circumstances at another time, or at the same time. For things are perceived to be good or bad according to circumstances. Indeed somewhere in the world, marriage always is both polygamous and polyandrous, according to environmental pressure and internal expansion—according to need, habit, or custom. Montaigne keenly observed that the laws of conscience, which we pretend to believe are derived from nature, really proceed from custom.

Assuming that group-marriage was first, polygamy and polyandry may be regarded as intermediary steps leading to monogamy. This form of marriage, although the latest and in many respects the best, is not necessarily final. If the sexes were equally divided, and if human nature were a little nearer perfect, monogamy would seem to be ideal. It fosters the virtues of the fireside, it stabilizes the home, increasing the cordial solidarity of family-life; it harmon-

izes with the longings of womanhood in its flower. For woman at her best craves precedence and she thrives on preference. Not only that, she scrutinizes the manner of man's attentions to her more than she tries to divine the real essence of his intentions. The reasons for this are deeply rooted in the very life of the race. She discriminates between the value of a present and the personal compliment it implies. Personal attention—that is to say, the expression of sentiment with its thousand tongues—she values above everything else. In sentiment she is a monogamist even when polyandric in practice.

But with all that may be said for monogamy, a question remains in the minds of some thinkers whether polyandry, had it been general, would not have freed woman, many centuries ago, to the extent at least that polygamy kept her in bondage. Certain it is that neither polygamy nor monogamy, by itself, has done much for the freedom and the spiritual elevation of woman. On the contrary, these two forms of marriage have been at the root of innumerable varieties of violence and cruelty, including slavery and prostitution. If we leave out of marriage the spirituality of union, so uncommonly found in it, one form is about as degrading as another. Woman never can hope to attain her higher spiritual possibilities until she

achieves freedom. So long as she is not economically free to marry nor legally free to divorce, she is held in loathsome restraint. Her noblest enchantment relies on her freedom of choice to mate with the man she loves; and her meanest bondage is the marriage-yoke that holds her to the man she hates.

No end of nonsense is rehashed as sentiment. The sacredness of our marriage system is preached beyond all reason. No system ever yet devised is sacred, unless sacredness is comparative and measureable: this is sacred, that is more sacred, and something else, most sacred. What could be more ridiculous? The horror of adultery springs from vanity, superstition, and custom rather than from outraged virtue. For there can be no virtue in sexual fidelity where either party is capable of violating the marriage vow. The sin of adultery is hypocrisy or deceit. Everybody knows that thousands of the noblest human beings have slipped the bonds without suffering or inflicting the least possible harm; that sexual fidelity without love and contrary to wish is as grossly immoral as prostitution. Our marriage system is a very loose ball-and-socket or universal joint of connection, whereas true marriage is a rigid *unity*, the happiness of which is unconscious of its cause and conscious only of its being. This *union* automatically dissolves when either party

becomes aware of its irksome rigidity. This embraces the ethics of real marriage so far as the personal relations of the coupled are concerned.

Monogamy, as an institution, is comparatively recent; and it was founded principally on religion, although there are some sensible secular reasons at its base. As an institution it is not a complete success. It is taught by the professional religionist that monogamy is the friend of woman—her liberator and, through this or that brand of grace, her salvation. The plain truth is that this particular system has driven more women to prostitution, directly and indirectly, than almost any other cause.

Prostitution is not a self-created evil, nor does it originate in the depths of innate, unmitigated depravity. It is a social evil that springs from many sources, one of which is an artificial attempt to thwart a powerful natural instinct, or the mistaken endeavor to throttle rather than to guide an elemental passion. Our form of marriage, together with its associated system of morals, makes no provision for the unmarried who for one reason or another can not marry, nor for the mismated who are held merely by form. Prostitution, a miserable makeshift, ruins both men and women while responding to the most imperious command, save

one (that of hunger), issued by Nature to her living beings.

A few words by Grete Meisel-Hess, one of the deep thinkers on this subject, will help to make my meaning plain. If there were space to spare, I should like to repeat the chapter on "The Necessity of Prostitution", in her misnamed book, "The Sexual Crisis". The book is misnamed, because there can be no crises in the broad evolution of sexuality. These relations are so fundamentally a part of life itself that they never can take on the nature of a crisis whilst life endures in the orderly phenomena of our universe.

"The necessity for prostitution depends mainly on social causes, which culminate in our marriage system. The happy marriage of the securely placed wife is founded upon the degradation and debasement of another woman, the prostitute, who is required to become a sexual instrument because she must furnish for men a preliminary stage on the way to marriage. The insistence upon two extremes for neither of which human nature is adapted, creates the prostitute. These extremes are, on the one hand, the ideal of a satisfactory marriage, and on the other, as the only alternative left open to women by conventional morality, the demand that if unmarried they should lead an utterly barren life of renunciation. The heaven

of marriage, the inferno of the brothel, or a complete negation of the sexual life: these are the only alternatives for women—unless indeed we accept Luther's suggestion that 'they must all be strangled'. . . .

"We readily can understand how men have been forced to organize the institution of prostitution, for men are simply incapable of enduring such a state of affairs. Even women can not endure it without suffering both in body and in mind. Logically enough, man has found a satisfaction for his own need which is forbidden to woman by her very nature. . . . In verity, the burden of misery and disgrace that falls upon the prostitute, whilst the man who makes use of her goes free, should attach to the society that renders possible and indeed inevitable this degradation of the human sexual life. . . . Prostitution is a necessity, a regular occupation, an economic livelihood in the capitalist market, a mode of life which millions of women are economically forced to adopt".

Monogamic marriage is a contract not so much between two persons as between a couple and society. For its own purposes, society demands of sexual unions certain assurances. There must be an established order of parentage to secure the order of succession in property rights. If society is to exercise a guardianship over personal rights, it must be a party

to the contract of marriage between couples. The contract between the two must be subordinate to that between the couple and society. Thus the ethics of marriage stands on two legs: (a) ethics governing the relations between those coupled in marriage; and (b) ethics governing the relations between the married couple and society. This is the essence of all questions arising from the ethics of marriage and divorce.

So far as society is concerned, it makes rules and is satisfied when they are followed. It is not interested in the particular hardships of its general rules, further than to adjust differences arising from the infractions that are brought to its attention. Hideous immorality thrives under the protection of society so long as this immorality is conventional; but unconventional virtue and immorality alike are liable to social inquisition. Good and bad marriages have the same social standing. Marriage permits the birth of children of hatred and disease equally with those of health and love. Marital brutality stands on the same level with the tenderest of conjugal relations. Society lacks judgment and it never was just.

In an elevated state of society there would be no friction between the personal ethics of the married and the impersonal ethics binding the couple to society. Therefore, just in proportion as society lacks discrimination and soul,

its individual members are rightfully entitled to exercise discretion in their personal conduct. Even the most stupid society assumes that the individual has some sense; for if he had none, there never could have been a social state.

The best way to elevate society is to educate its units, thus interlocking their personal interests and forcing the outflow into the common weal. Nothing is gained by trying to tear down and build anew. Ethics is of slow growth. It rests on the individual at last. When the majority of individuals comprising a state acquire intelligence enough to understand the iniquity of a loveless marriage, divorce will be easy, respectable, and free. When the general intelligence rises a point or two, the church will lose its voice both in marriage and divorce. When men and women generally realize the immorality of sexual relations unsanctified by a high mutual desire, the closed marriage relations will adjust themselves to the open relations between marriage and society, and prostitution as it now exists will be no more.

Women will not be free until they become intelligent enough to see the sinfulness of their present bonds, and clever enough to shake off their shackles without too much noise. When they have become mistresses of their own bodies and souls, church and state will cease to

forge fetters. The freedom of women—all they can hope for, and all they deserve—lies in their own hands. The key to that freedom is a little more knowledge and adroitness.

BIRTH CONTROL

NATURAL morality recognizes certain personal rights. For example, no one questions a person's right to the choice of food, clothing, and shelter. Sane folk never think of meddling in the sexual affairs of others. No right-minded person tries to tyrannize over love. Religious views are supposed to be personal, and their right of possession is unquestioned. No decent man would force a woman to become a mother against her will. By comparison, the act of rape merely in itself, is a virtue. If self-respect is anything more than a pleasing fiction, a woman should be the mistress of her own body. Natural ethics gives her the right to protect her chastity. Common decency permits her to choose the man who is to father her child. If there are any personal rights in this world over which church and state should have no control, it is the sexual right of a woman to say, *Yes* and *No!* These and similar rights are so deeply imbedded in natural morality that no clear-headed, clean-hearted person would wish to controvert them.

At this point social ethics intervenes. Natural and social morality, so to speak, are interwoven. In effect, there are no detached personal rights existing as such in a state of society. For example, a man selects food and clothing within the loose limitations of the general rule made for the well-being of all, amongst whom he lives. Sexual relations are restricted by society. Love is the only social anarchist not in chains because society has found no means to enslave it; church and state have not been able to govern it either by fear or by law. Religious belief, largely a matter of accident, is tractable because gravitational. Enforced motherhood, through marriage or otherwise, is a mixed form of slavery. Voluntary motherhood is the glory of a free soul. The church for its own purposes, and the state for the welfare of society, prescribe regulations for the sexual relations between men and women. The church with mingled sincerity and hypocrisy stresses the future good of the soul in the present restrictions called marriage. Through marriage the state seeks the good of society as a whole. In the highest and best sense, both church and state have failed.

Marriage then in one form or another, is the general rule to which men and women in a state of society conform. Naturally, this rule can take no account of exceptions, few or many. Even with the purest of purposes, marriage,

under church and state, becomes a form of slavery so far as the woman is concerned. Against the bondage of marriage, if not actually out of it, arise the evils of prostitution and the many hardships attending other illicit sexual relations. Under the law, marriage makes the woman a brood slave. Legally or illegally conducted prostitution degrades and diseases the individual, and it demoralizes society. Free sexual intercourse burdens society with persecutions for the crime of which society itself is guilty; and it debases society by the brutal punishment it inflicts upon the innocent. Under marriage, woman loses the right to protect her chastity; but even if she retained that right it would be an empty one, continually subjected as she is to the pressure of custom and the desire of her husband whose employment of force is encouraged by church and state; or she yields to a burst of her own baser passion.

Is it any wonder that the supreme matter of reproduction is left to chance, to brutal force or gentler persuasion, to psychologic pressure; or that conception should result from ignorance and the spurts of mere animal desire? Children come when they are not wanted, not needed, and when they can not be properly nourished and nurtured. Many of these children are born of indifference or hatred, of weakened mothers and unfit fathers. Untold thousands have no

other heritage than disease and filth, and thousands of others, only shame. Millions of defectives are dumped on society to be persecuted after fashions of the poultry yard. Almshouses, jails, hospitals, and expensive judicial machinery must be maintained for the protection of this same precious society.

Everybody knows that this is true; but how far-reaching and how terrible this truth is, everybody does not know nor does everybody care.[1] As a race, we are densely ignorant, cruel, and barbarous. We do know enough however to realize that something can be done to make a bad matter better. Many thousands of noble men and women have tried and are trying now to improve our sorry lot. There always is enough kindness in humanity to strive for better conditions.[2]

The question is, What shall be done? Shall we re-organize society? That is a big job. Shall we do away with marriage? That is impracticable. Shall we destroy the state and start a new system of economics? That is only a dream. However well it might be if the dream should come to pass, certainly we are not ready for anything of the kind now. Shall we destroy the church? First, we shall have to enlighten the mind to a degree beyond our present means;

[1] See Woman and the New Race (Margaret Sanger).
[2] See Birth Control or The Limitation of Offspring (Wm. J. Robinson, M. D.).

and besides, the church will destroy itself with its own poison—all it needs is no opposition. As soon as it becomes clear to the mass-mind that the church and prostitution are equally related to religion, one no more than the other, the church as an institution of slavery will pass as many others have, and, as it is hoped, all such institutions must. Shall we wipe out prostitution? How? Can we do nothing then but build jails and asylums? Shall we go on legislating? We may as well take up our little brooms to sweep back the tides. We may as well pass laws against the weather to protect shivering poverty. Ah, but we have philanthropists! So we have, and we have had them for a long time. Having permitted unmoral men and women to pile up vast riches at the expense of others under our laws, shall we make other laws to convert the loot into "philanthropy", and thus destroy the last vestige of self-respect still clinging to the unfortunate?

We have a practical remedy of great promise. In the present state of affairs, one thing can be done for the boundless benefit of coming generations; that is the voluntary reproduction of our kind. This will have to be determined largely by the women themselves. There is no objection to a little help from the men; but the feminist movement will find it necessary to agitate the wisdom and to set the example in

practice, if it would succeed. Women will have to teach women how to avoid conception when unwilling or unfit to become mothers. They should be taught, who are stupid enough not to know, how sinful it is to bring forth an unwelcome child; how fiendish it is to thrust a human being into life if that life must be one of misery.

If every woman had at hand safe means to prevent conception, the millions of abortions and miscarriages annually trailing disease and death, would be prevented, and untold anguish abolished. These means are available; they are as harmless as a tepid bath and as pure as a drop of dew. Physicians know and have the legal right to prescribe them; but doctors generally are too hidebound or too mean to reveal this knowledge. Fortunately, thousands of women also have this knowledge. It is from them that the less fortunate sisters may hope for relief; and this enlightenment can be given successfully through an organization of women under the feminist movement. It should be made known universally that there are no moral nor other grounds against the prevention of conceptions; but that there are many reasons why induced abortions and miscarriages are harmful morally and physically; that "race suicide" is not to be feared whilst human nature remains human nature. For men and women will be parents so long as they are men and

women. The race is in no danger of suicide with the control of births in the possession of women. On the contrary, the race will grow better, stronger, happier with women the mistresses of their own bodies. The want and will to reproduce are vital instincts of our nature. The power and the wisdom to control our reproduction can only strengthen the generative potentiality of our being.

Laws prohibiting women from teaching their sisters how to prevent conception are generally disregarded. It is assumed that there is no virtue in obeying an act of legislation that is vicious, and so vitally harmful to the race. In the history of mankind, jails never had much terror for righteousness. But it is not necessary to pay the extreme penalty prescribed by bigoted law makers. The means of preventing conception can and should be given to all women in a lawful manner, for the means is a simple whiff of knowledge, easily imparted in a whisper.

WOMEN AND THE GREAT WAR

 OMEN'S part in the most tragic of all wars, is well known. Their help has been felt in every branch of military service, and in all the departments of civil life. On both sides of the Eastern battlefront, they were found fighting in the trenches, shoulder to shoulder with the men. Indeed several of the belligerent powers regularly enrolled girls in the fighting ranks. The Women's Auxiliary Army Corps was as much a part of the British army as was the Royal Engineers.

As manual laborers and fieldhands, women took the place of the men; as skilled laborers, their work in the factories was indispensable, and their endurance surprising. Almost over night wives and daughters became shop-keepers, wholesale merchants, traders, stokers, and drivers. In May, 1917, over 2,000 women were employed by the British Admiralty, alone.

Women nurses were the good angels to broken and blinded men. Wherever women entered the professions, their work equaled that of the men. In a word, feminism was recog-

nized world-over as well as in the warring countries. It is admitted everywhere that without the courageous efforts and the sacrifices of women, civilization now would be in a sorry plight. Orphans were cared for; the homeless were housed; the needy fed and clothed by women. Nothing has been too menial for their willing hands—nothing too arduous for their weary bodies—nothing too terrible for them to face with hope in their souls.

Whenever women have been called to administrative and executive positions, they have been successful; their inventive genius is equaled only by their enthusiasm; their emotional qualities have not unfitted them for any service, however trying. Not once have they failed. Besides bearing all this unusual stress of mind and body, they cared for their children, and they maintained their homes. Never again shall it be said that their sex disqualifies them for any human achievement.

The noblest thing in the war was done by the women of France when they made provision for the children forced on the wives and daughters of the invaded countries by the soldiers of the Central Powers. The French women became at once super-Christian, for they arose to the full height of humanity—beyond which there is no eminence in this world.

These women were opposed by all the worst

and by some of the best elements of passion: patriotism, love of the unsullied home, disgust, hatred, jealousy—outrage unspeakable! Soldiers on leave, returning to their families, found there the innocent intruders, thrust in and left by infamous enemies. The most of these husbands and fathers were hardened by the savagery of war; they were so brutalized by conditions that they could not endure the presence of such children in their homes. It is but natural that soldiers, blinded by cruelty to the claims of innocence, should be deaf alike to the wails of mercy and the behests of justice. They saw in these baby-victims only the hateful reminders of their own dishonor—the living symbols of bestiality that had besmeared their homes during their absence. But the splendid womanhood of France found a means, at once tactful and humane, of providing for the despised and helpless little beings. Womanhood softened the cruelty so wickedly inflicted. Thanks to the active influence of French womanhood, the outcasts were adopted by the government, to be reared and educated by the state. No holier act ever was performed by mankind.

The strange elements of courage are as necessary in war as are troops and armament. It is owing to the women of France, Belgium, and England that the *morale* of their fighting-men remained fine during hard and disheartening

times. The women kept up the will-power of the armies at war; and women maintained the stability of governments when it seemed that anarchy was at hand, and that civilization must crumble to dust.

Courage is born of motherhood. Man is the body but woman is the soul of the race. One presides over a spiritual realm, at the gates of breath; the other fights at the frontiers of our material life. Thus motherhood, actual and potential, always has been the moral support of war. This seems strange when one reflects that women and children are the chief sufferers; but the reason is that from motherhood flows orderly unselfishness; that is to say, motherhood is the fount of ethics. Motherhood posits the home; the home posits the family; the family, the community; the community, the nation. Ethics assumes that the highest good is attained through personal sacrifice to family, community, country, race. Ethics submerges the instinct of self-preservation, of creature comforts, of individual interest; and the ethic impulse rises to those higher levels that have been found to support the general good. Hence on woman relies largely the *morale* of embattled men.

This war may or may not determine the issues between autocracy and democracy; it may or may not hasten the adjustment of differences

between capital and labor; and it may leave unsolved the problems of militarism, eugenics, and caste; but it will free women from many an age-old bondage. It was in effect a war between civilization and barbarism, in which the money-changers had a sinster hand. The stakes were the heaviest for which men have fought on the field or played in the Chancelleries of nations.

Class distinctions are becoming less marked. Religious differences for the moment at least were forgotten. One soldier did not ask another, who fought at his side, if their creeds agreed; neither did the fraternity of the trenches cluster around the artificial standards of caste. Among the belligerent women much of the moonshine of title and social standing was put aside. The moonshine that would not down was found in our own country, where isolation from the horrors of war made it hard for the wife of the profiteer to give up the distinctions founded on wealth.

The French soldiery cared little about the outward forms, the ceremonies, the dogmas of the church. Catholics and freethinkers were brothers-in-arms and cordial comrades. Both the Catholic mode of thought and the freethinkers' method of reasoning, were respected by all. The morality of the one was as good as that of the other. Heroism has no room for the differ-

ences of creed. Each soldier does his part and the rest is left to God, or Fate: *Il faut ce qu'il faut!* or as the Italians say, *Che sara sara!* That is all. The brave priest and the gentle nun were neither more nor less because of their faith, for "faith without works is dead".

Philosophers will inquire how this war has affected the status of womanhood in civilization. It seems to us that womanhood has risen to such heroic proportions that it stands transfigured before a background of barbarism. It seems that the knell of woman's bondage has sounded; and that her economic standing never more will be the same. Onward through the years, women must be the equal partners of men in the co-operating for the material and the spiritual advancement of the race.

There is another, sadder phase of the phenomenon. Millions of women have been debauched by this war—and the end is not yet in sight. Prostitution flowers along the military highways as it did around the camps. It has spread infection and moral poison that will contaminate the stream of life, and the flow of generative ethics, for many a year. The general tone of sexual morality has been lowered by brutal force and by a thousand insidious influences. The barriers reared by decency through the ages were broken down over a large part of the habitable earth. The effects of all

this on the status of womanhood in society, and therefore on society itself, can not be estimated now. The third and fourth generations perhaps shall have turned to dust before it will be possible to compute the evils, and to appraise the benefits, flowing out of the late war. We hope that the race has suffered no lasting harm; that in the fulness of time all its wounds will heal and leave no scars; and that womanhood will rise to nobler heights through "the great right of excessive wrong".

MENTAL ATTITUDE

WE are beginning to appreciate the importance of point-of-view. Society is gradually discovering the need of righteousness in mental attitude. We shall yet learn how wise it is to be kind—how ignorant it is to be cruel. Hospitality to light and change, hostility to darkness and stagnation must, in time, characterize the mental attitude of humanity.

So far as we know to the contrary, there is no gain without loss. Change is justified or not by the relative nature of the gain or loss. As we have put on the first rags of spiritual grace we have had to lay off the glossy coat of animal perfection; yet we conceive the change from prehuman to human beings a good one. When man assumed the erect posture, he became the living symbol of exalted ideals. Through continual conflict with a brute propensity to walk on four feet, instead of two, man won his soul. But the change of posture left his bowels poorly supported, and it made them prone to disorder. His bulging brain causes him to suffer; his highly developed nerve-cen-

tres easily degenerate. While learning to walk spiritually, he stumbles and falls into physical disease. His deft fingers, uncanny in their skill, are in striking contrast with some of his other organs, which are crippled and shrinking. As an animal, man is a failure; as a demi-god, he is a disgrace. Only as a torch-bearer is he noble. Only in his mental attitude may he become divine. This hope justifies all his losses. This hope is the banner of his soul.

Just what primitive man's mental atittude was, remains speculative. As Herbert Spencer suggests, it is not easy for a grown person to think a child's thoughts; so much more difficult is it to think in terms of the remote past. Very meager help is to be had in the little we know of the psychology of the lowest among contemporary peoples. For owing to many factors, some of which are hidden, and others of a devious devolutionary character hard to follow, it is probable that the thoughts and ideas of the lowest living savages are different from those of the long-vanished primitive people. Strange as it may seem, and shocking as it must be to our pride, if we would discover the traces of primitive mental attitude, we must search, not in the dark cul-de-sacs of contemporary savage branches, but in the bright main avenue along which the descendants of early man are now marching toward civilization.

The peculiarities of physical environment press heavily upon the mental characteristics that determine social phenomena. The nearer we approach the primitive type of mind, the stronger grows the tendency to imitate and the weaker becomes the power to reflect. In low states of society, individuals live, as it were, by prescription; social phenomena seem crystallized; and initiative appears to be absent. The type of the hut is fixed almost as rigidly as that of the nests of birds. The underdeveloped nervous system is well adapted to physical hardihood and toughness, but it restricts an output of muscular and mental energy equal to that of the more highly developed organism.

The faculty of observation in primitive man necessarily was active, and therefore superficial in its powers. His restless and perpetual perception absorbed nearly all his mental energy. Among our most advanced peoples, the same effect crops out in artists. Persons whose vocation it is to observe and ceaselessly to note variations in color, tone, mass, line, and balance, seldom are deep thinkers. Highly specialized perception, ceaselessly exercised, leaves little time and less energy for deliberate reflection. The same principle shows itself in the mad rush of our times in pursuit of material gain. Obviously, the energy consumed in commercial occupations can not be employed for

ethical advancement any more than in philosophic deduction.

Early man probably was devoid of wonder and incapable of astonishment. He knew nothing of the uniformity of relationship, called law, that colligates phenomena; therefore he was not surprised at anything. With no idea of natural causation, his credulity was profound and his curiosity slight. It may have required hundreds of thousands of years for a single abstract idea to enter his mind. His mental attitude was emotional and extremely variable. It was subject to gusts of fury—to sudden storms of passion. His mentality was barometric and meteorological. This type of mind is not rare to-day; and it is painfully notable in the conduct of mobs at lynchings; it is commonplace in political and religious demonstrations. For individual examples one need not look beyond personal acquaintances. Herbert Spencer draws a faithful likeness of the type, which includes some of our friends, in his description of an ideally primitive man: "Governed as he is by despotic emotions that successively depose one another, instead of by a council of the emotions shared by all, the primitive man has an explosive, chaotic, incalculable behavior, which makes combined action difficult".

This persistent type of mind has been the

stumbling-block of the feminist movement, just as it always has been the barrier to all other progressive enterprises. Progress is possible only where primitive inertia breaks down. The large element of public opinion that would relegate women to a distinct sphere of action regardless of economic pressure, legislative injustice, and newly risen necessities of conduct, is primordial. Public opinion is stupid when it fails to take account of the inevitable reactions to the ceaseless struggles of collective life. Public opinion is primitive in attitude when it would limit the aspirations of any human beings, white or black, brown or yellow, male or female. It is primitive when it would circumscribe any human beings in their endeavors to emerge from a hateful to a happier state. Public opinion is primitive that would unconditionally limit the environment of women to the paraphernalia of the maternity-ward or to the four walls of a home. It is primtive public opinion that would constrain the obligations of women to the bearing of babes merely to swell the ranks of voters, religious sects, and soldiers. It is a brutally primitive public opinion that would force woman to "keep in her place"; the spiritual attitude of that opinion welcomes slavery, encourages the exploitation of one class to fill the pockets of another class.

As I have said, woman fell into her position

naturally in early times; and just as naturally she has tried to climb out in later times. Like man's, her way has been progressive and retrogressive by turns; and her relative position always has registered the state of society. "The habitual behavior to women among any people indicates with approximate truth the *average* power of the altruistic sentiments; and the indication thus yielded tells against the character of the primitive man. The actions of the stronger sex to the weaker among the uncivilized are frequently brutal, and even at best the conduct is unsympathetic. That slavery of women, often joined with cruelty to them, should be normal among savages, accepted as right, not by men only, but by women themselves, proves that, whatever occasional displays of altruism there may be, the ordinary flow of altruistic feeling is small".[1]

Barbarism kept woman down for ages by hard work and heartless indifference. Civilization has kept her down by treating her as a spoiled child, by pampering her worst traits, by making inadequate provision for her needs, by neglecting her rights as a human being. It has been obvious for a long time that only through woman's own intiative would her position be improved. She has taken this initia-

[1] Herbert Spencer.

tive, which has been followed by the encouraging and prophetic results known to all.

Woman made her first great steps toward freedom virtually unaided by man. But there can be no successful human movement without the co-operation, eventually, of both sexes; that is to say, co-operation between the two radically different groups of sex-characteristics. For biologically, society is made up of composite individuals belonging to separate orders; these are, loosely speaking, *male* and *female*. But it must be borne in mind that, economically, society contains a third factor that is composed of *neuters, parasites, reactionaries, slaves,* and *masters*. The neuters are the young children—mere dimpled hopes of humanity—together with the sexless crew, always of uncertain age. The numbing hardships of poverty, with its wretched deprivations, desexualize hordes of human beings early in life. The negative mental attitude of these unfortunate drabs always hinders progress. The parasites, never content with their pickings, are distinct social burdens. The reactionaries are the little foxes that spoil the vines. The economic slaves merely give sustenance to society, and perish. The masters who wield the powers that be, content with the existing order, naturally oppose a change. Is it any wonder that the collective attitude of society is a wall hard for

woman to surmount in her struggles for freedom?

It will be asked with reason, How shall this co-operation of the sexes be brought about? There is only one answer, By *enlightenment.* Fumbling in the dark will not do, for we have tried that. Beautiful theories will not do, for we have thousands of them that hardly could be improved. We must have the practical application of ethical formulæ. We must have applied ethics, as we have applied mathematics. We must have economic and social engineers, since this is an age of engineering, just as we have mechanical and other engineers. Of economic preachers, of social reformers, of legal and religious pettifoggers, we have enough and to spare. We need efficiency engineers for the different branches of economics, working under intelligent organization. Naturally, we look for these sociologic efficiency engineers among the women actively engaged in the feminist movement.

We are in need of the enlightenment that will enable the male sex to see the economic value of men being men and of women being women; that is to say, the importance of cultivating all the best masculine characteristics in men, and the need of the assiduous development of the best feminine qualities of the women. The same lamp that lights the way to an orderly de-

velopment of manliness in the male sex, and to womanliness in the female sex, will enable both sexes to see the sanity of a general ethical as well as of the special sexual co-operation that keeps the race alive, sustaining the gaiety of nations. Both sexes will be led to see the wisdom of thwarting the evil influences now at work in society; and together, men and women will discover the means of ridding society of its enemies. This is the essence of internationalism; but the cause of internationalism never will be advanced by those who decry their own nation. Patriotism is a necessary step toward internationalism. Those who are false to their own families, to their own friends, to their own country, are not likely to be true to the broader principles of humanity.

This light will have to be spread by the propaganda of the feminist movement—which really should be called the *humanist* movement—until both men and women can see clearly that there is, in actuality, no woman's movement involving merely woman's rights, but rather that there is a progressive human movement, now headed by women, which involves the rights equally of both sexes.

Society must be taught by practical means, rather than by precept, the importance of a righteous mental attitude; widespread organization must demonstrate the necessity of this

imponderable; and it must show the efficiency of sex-co-operation in the successful pursuit of a civilization that shall know, economically, neither color of skin nor prejudice of religion, neither sex nor caste; that shall tolerate neither master nor slave; that shall permit neither the overrich nor the miserably poor to disgrace mankind by their presence.

Slowly dawns the day of enlightenment for humanity. As superficial observation and incessant perception of earlier periods gave way to reflection, so will the spiritual day follow the night of materialism. Humanity has developed eyes of the mind, and sentiment has placed them in the soul. Enhanced consciousness thrills an ever-increasing number of men and women. The mental attitude of mankind is painfully rising from its knees to stand erect. Human vision has enlarged its field. Multitudes already see through the eyes of the soul. These eyes demand of the mind an attitude that was impossible to our early progenitors. The necessity for divers points-of-view has become plain. The light of civilization may be expressed perhaps in terms that imply diversity of viewpoints. Take for example such a commonplace thing as a tree:

The artist looks upon a tree and sees masses, lines, tones, shadows, and colors, through a gauze of air and the medium of his own person-

ality. He sees these things in their relations, and from their relationship he draws expressive deductions which he unifies and vivifies with soul. He accents the beautiful even in noting the ugly. To him, objects turn into the rhetoric of thought, into a mood of being, or as Amiel says, into a state of mind.

It is very fine to see a tree as an artist sees it, for he looks upon it through one of the little lenses of the soul. Unless he is a very gifted artist, he never suspects that the soul has a thousand other æsthetic eyes longing to behold this ordinary object.

The student in science looks upon a tree through very different eyes. He sees family, and he peers into function. He observes the chemistry of cell-action, and he even may dream of cell-intelligence. He tries to account for the play between chlorophyl and sunlight; and he constructs beautiful theories in a vain effort to explain the two phases of heliotropism. He thinks he sees how the cells overcome gravity to a varying degree; and he notes carefully the fixed habits of consciousness shown in constant patterns, which to him form variety of species.

It is very wonderful to see a tree as a student in science sees it; but he also looks through only one of the little lenses of the soul. Unless he is a very wise student, he never suspects how little he sees of a tree.

The religionist looks upon a tree and sees one of the many commonplace things God-given to man. With commendable meekness, he thanks God for the beauty of trees and for the comfort they give. In their manifold service to man, he sees the kindly wisdom of Providence. He beholds a tree through another little lens of the soul; and unless he has the inspiration of a prophet, he never suspects how little his one little eye sees of a tree.

The moralist looks upon a tree and beholds ethical parallelism. He does not, ordinarily, ponder whether environment and psychical lines intersect or run parallel. He only sees in a splendid tree that which suggests rectitude of spirit; and the thought leaps to his brain: How fine a thing it is to be aplomb of soul—upright and proportionate in character—indifferent to the breath of cavil as the oak to the quarter of the wind!

To him, a tree is symbolic; therefore he regards an ugly tree with aversion. The deformed trunk and the unsightly limbs speak to him of moral obliquity. He applies the axe with sorrow, if he possess greatness of soul; but if his soul is small, he swings the axe with the unfeeling stroke of a Javert, an executioner of the law—or with the smug content of a Calvinist inquisitor. He sees a tree through another

little lens of the soul, but he never suspects how little he sees of a tree.

The poet looks upon a tree, and sees all its leaves alive with dreams. Fairies are everywhere among the boughs; and all the branches are highways and by-ways of travel. He sees the play of color, the glints of light, as faintly twinkling stars in airy pools of shadow. He sees the happy homes of birds, where trysting lovers meet, and a whole world of joyous insect-life; or else

> "Upon those boughs which shake against the cold,—
> Bare ruined choirs, where late the sweet birds sang",

behold the symbol of mortal tragedy! He sees the pastoral days emerge bright and free from their barbaric gloom; and out of these days he makes golden poems to gladden the heart of man.

He sees how close trees ever have been to the human heart, and he feels again all the wondrous influences they have had upon the mind; he knows how helpful they have been to the soul. He sees parenthood and brotherhood and comradeship in trees. He sees religion in their shadows and hope in their blossoms. He catches glimpses of a strange spirit that has been imprisoned by Sculpture in the stone of Gothic structures. He walks among trees with venera-

tion. He puts forth his hands to touch them affectionately. He holds converse with them readily and easily, as with his own kind. He feels an awe in their presence that he never feels in the presence of men. And he knows, perhaps better than the others, that he looks upon a tree through only one small eye of the soul. And if he is a great poet, he becomes enchanted with the wonderment of it all; and this enchantment he passes on through the generations of life to far-off epochs.

Now for the sake of antithesis, let us take another example, Woman. The average man too long has looked upon the female of his kind principally through the little pig-eye slit, which sees only sex. His eyes are no better than button-holes burned in a blanket—and they are just about as perceptive. His cunning little primitive eye is no improvement on the brute's; his optical evolution ceased in a fringe of lashes. When he sees sex, he thinks he sees all there is to woman. As through a glass darkly he regards her as a beast of burden, as a thing of comfort, as the breeder of his spawn, as the warder of his brood, as the unpaid keeper of his house. He is as indifferent to her rights as he is sensitive to his own. He is horrified at the thought of a vote in her hands. He believes himself to be a special creation of Providence, and he is convinced that woman was an after-

thought for his benefit. His attitude conforms to his spiritual blindness.

There are other men—good men—who regard women through eyes that see only mothers, sisters, and wives. These men entertain sentiments born of a vision that is fair, as far as it goes. But they can not see the slaves of economic bondage, nor the drowning women caught in the rising flood of altered social conditions. The little eyes of these men see both sex and self-sacrifice, but they are incapable of broader spiritual vision; their eyes are adapted only to the twilight of sentiment and to the half-light of justice. At best, they treat women kindly; at worst, indifferently; and they mistake condescension for comradship. Sleek and rotund, they go through life never once suspecting how blind they are.

There are other men who see through the eyes of the soul by the light of reason. These men behold in women something higher than sex, something holier than sacrifice: the right to relative justice. Such men see a saintliness in motherhood that transcends natural accident; they acknowledge the sustaining graces of womanly companionship; they feel its rapture and warmth; they recognize the dignity of her character, the sanctity of her person, and the possibilities of her destiny. They see beauty in her form, loveliness in her ways,

and they fancy that they see an aura called divine hovering about her. They see all her rights too clearly to talk of "granting her privileges." In her personality they behold the most of human hope. For they see that woman symbolizes an endless avenue of evolution; that she may be likened to a poem of promise; that she represents progression; and that she is double-wombed, being psychical as well as physical; and that she is double-germed, having spiritual as well as protoplasmic possibilities; that she stands for infinity, because she suggests endless development, whereas man represents only a blind alley branching off the highway of progress, and symbolizing power rather than promise; that he is too imperfect to represent infinity; that in terms of duration, man expresses the immediate present whilst woman, through her babe, expresses the endless future.

Once man's spiritual vision shall be broad enough to encompass these things, his attitude will change; and he will perceive it to be a duty, a privilege, and a pleasure to co-operate with woman in her efforts to reach her highest possibilities. For as the poet says:

> On this soft anvil all the world was made.

The following pages contain announcements of some of The Critic and Guide Co.'s publications

AN EPOCH-MAKING BOOK

Never-Told Tales

GRAPHIC STORIES OF THE DISASTROUS RESULTS OF SEXUAL IGNORANCE

By

WILLIAM J. ROBINSON, M.D.

Editor of the American Journal of Urology and of The Critic and Guide

Every doctor, every young man and woman, every newly-married couple, every parent who has grown-up children, should read this book.

Every one of the tales teaches a distinct lesson, a lesson of vital importance to the human race.

We knew that we were getting out a useful, a NECESSARY book, and we expected it would meet with a favorable reception, but we never expected the reception would be so extravagantly and so unanimously enthusiastic. There seems to have been a long-felt but dormant want for just such a book. One reader, who has a fortune running into the millions, writes:

"I would have given a good part of my fortune if the knowledge I obtained from one of your stories to-day had been imparted to me ten years ago."

Another one writes:

"I agree with you that your plain, unvarnished tales from real life should have been told long ago. But better late than never. Your name will be among the benefactors of the human race for having brought out so forcibly those important, life-saving truths. I know that I personally have already been benefited by them."

WOMAN: HER SEX AND LOVE LIFE

FOR MEN AND WOMEN

By WILLIAM J. ROBINSON, M.D.

Illustrated

This is one of the most important, most useful books that we have ever brought out. It is not devoted to abstruse discussions or doubtful theories: it is full of *practical* information of *vital* importance to every woman and through her to every man, to every wife and through her to every husband.

The simple practical points contained in its pages would render millions of homes happier abodes than they are now; they would prevent the disruption of many a family; they show how to hold the love of a man, how to preserve sexual attraction, how to remain young beyond the usually allotted age. This book destroys many injurious errors and superstitions and teaches truths that have never been presented in any other book before. In short, this book not only imparts interesting facts; it gives *practical* points which will make thousands of women, and thousands of men happier, healthier, and more satisfied with life. Certain single chapters or even paragraphs are alone worth the price of the book.

You may safely order the book without delay. But if you wish, a complete synopsis of contents will be sent you.

Cloth bound. Price $3.00

THE CRITIC AND GUIDE CO.

12 MT. MORRIS PARK W., NEW YORK

I consider myself extremely fortunate in having been instrumental in making this remarkable book accessible to the English reading public. It is a great book well worth a careful perusal.

From Dr. William J. Robinson's Introduction.

The Sexual Crisis

A CRITIQUE OF OUR SEX LIFE

A Psychologic and Sociologic Study

By GRETE MEISEL-HESS

AUTHORIZED TRANSLATION BY EDEN AND CEDAR PAUL

EDITED, WITH AN INTRODUCTION

By WILLIAM J. ROBINSON, M.D.

One of the greatest of all books on the sex question that have appeared in the Twentieth Century.

It is a book that no educated man or woman, lay or professional, interested in sexual ethics, in our marriage system, in free motherhood, in trial marriages, in the question of sexual abstinence, etc., etc., can afford to leave unread. Nobody who discusses, writes or lectures on any phases of the sex question, has a right to overlook this remarkable volume. Written with a wonderfully keen analysis of the conditions which are bringing about a sexual crisis, the book abounds in gems of thought and in pearls of style on every page. It must be read to be appreciated.

A Complete Synopsis of Contents Will Be Sent on Request

350 PAGES. PRICE $3.00

THE CRITIC AND GUIDE CO.

12 MT. MORRIS PARK, WEST :: :: :: :: NEW YORK CITY

A New Book by Dr. Robinson

Sex Knowledge for Men.

By WILLIAM J. ROBINSON, M. D.

ILLUSTRATED.

An honest, unbiased, truthful, strictly scientific and up-to-date book, dealing with the anatomy and physiology of the male sex organs, with the venereal diseases and their prevention, and the manifestations of the sex instinct in boys and men.

Absolutely free from any cant, hypocrisy, falsehood, exaggeration, compromise, or any attempt to conciliate the stupid and ignorant.

An elementary book written in plain, understandable language, which should be in the possession of every adolescent boy and every parent.

Price, cloth bound, $2.00.

Sex Knowledge for Women and Girls

What Every Woman and Girl Should Know

A Companion Volume to SEX KNOWLEDGE FOR MEN

Price, cloth bound, $1.50.

Population and Birth Control

A SYMPOSIUM

EDITED BY

EDEN and CEDAR PAUL

One of the greatest books on Birth-Control in the English or any other language. By writers of international reputation.

CONTENTS

Introduction, by William J. Robinson; Malthus, a Biographical and Critical Study, by Achille Loria; Birth-Control and the Wage Earners, by Charles V. SEX MORALITY

PAST, PRESENT AND FUTURE

Will monogamy or variety prevail in the future?

Is continence injurious?

Are extra-marital relations ever justifiable?

Should there be one moral standard for men and women?

Will our present moral code persist?

These and similar questions are here discussed by original and unbiased thinkers as well as by orthodox conservatives. No matter what your opinion on the subject may be, no matter whether your ideas on the relations of the sexes are those of the 15th, 20th or 25th century, you should read this book. Nobody who is earnestly interested in the sex question has a right to have any opinion on it without having read this volume, the price of which, in cloth, is $1.50, *including postage.*

Costs three dollars--is worth three hundred!

MARRIED LIFE *and* HAPPINESS

OR

LOVE AND COMFORT IN THE HOME

By

WILLIAM J. ROBINSON, M.D.

This is Dr. Robinson's nineteenth and best book, that is, best from the point of view of *usefulness*. For *practical* everyday usefulness we know of no book in any language that can compare with it. It is the one book on the subject about which we do not hesitate to use superlatives. Every page of it is crowded with advice and information — which mean Love and Happiness and conservation of Sex Power for the husband and wife, peace and harmony in the home, health and comfort for the children, and prolongation of life for everybody.

Not to read this book is cheating yourself of a great opportunity to increase the sum total of your health and happiness, of the health and happiness of those connected with you.

This book should be in every home. In the homes of professional people and of workers, in the homes of the rich and the poor, in the homes of the classes and the masses it will prove equally useful, equally inspiring, equally contributory to health, happiness and comfort.

The price of the book is three dollars. We have no hesitation in saying that for the valuable advice and information it contains it is well worth a hundred times the price. Isn't the maintenance of peace and harmony, the saving of a home from possible disruption worth three hundred dollars? It is *surely* worth three dollars, and you are certainly committing an injustice to yourself and your family if you do not secure a copy of the book at once.

A UNIQUE JOURNAL

THE CRITIC AND GUIDE

Dr. Robinson's Famous Little Monthly

It is the most original journal in the country. It is the only one of its kind, and is interesting from cover to cover. There is no routine, dead matter in it. It is one of the very few journals that is opened with anticipation just as soon as it is received and of which every line is read with real interest.

Not only are the special problems of the medical profession itself dealt with in a vigorous and progressive spirit, but the larger, social aspects of medicine and physiology are discussed in a fearless and radical manner.

Many problems untouched by other publications, such as the sex question in all its varied phases, the economic causes of disease and other problems in medical sociology, are treated boldly and freely from the standpoint of modern science. In discussing questions which are considered taboo by the hyper-conservative, the editor says what he wants to say very plainly without regard for Mrs. Grundy.

THE CRITIC AND GUIDE was a pioneer in the propaganda for birth control, venereal prophylaxis, sex education of the young, and free discussion of sexual problems in general. It contains more interesting and outspoken matter on these subjects than any other journal.

While of great value to the practitioner for therapeutic suggestions of a practical, up-to-date and definite character, its editorials and special articles are what make THE CRITIC AND GUIDE unique among journals, read eagerly alike by the medical profession and the intelligent laity.
